Well, I went with a wilson 5000 trucker (Center coil) mounted on my roof with a Firestick Disco Disc mount with a medium duty spring. So far so good. Thanks to all that responded.

2. Weird problem w/148f GTL + clarifier-shuts off

Newsgroup: rec.radio.cb
Date: 2000-08-01 00:00:00 UTC
From: notdareal@aol.com
Message-ID: <20000801001037.21036.00002189@ng-ch1.aol.com>
Source record: 46449

OK. Has anoyone had this problem? I have a 148f GTL, When I turn the clariifier all the way clockwise (in receive mode), the radio kinda shorts out, , By shorting out I mean it stays on but the freq. counter goes dead, and I get no receive. The TX light lights up too but of course I'm not transmitting. If I turn the clarifier back a little bit, the problem goes away, but turn it clockwise fully, and Bam the radio shorts. Also, the freq. counter doesn't change when I move the clarifier. Now get this, When I disconnect the antenna, I can turn the clarifier all the way clockwise and everything is fine, the freq. also follows quite well. What gives? I have pretty flat SWR and everything is grounded perfect (Wilson 5000 center loaded on roof). I had this problem in another vehicle too, so I tend to believe it is the radio. Any ideas? Thanks.

PS, is it me, or is the 148F gtl seem more cheaply made than the original 148's? thanks.

3. Re: Texas Star:EX 667V or EX 500V?

That's interesting, a 100% efficient amp.

CitySlicker <manno_d@hotmail.com> wrote in message
news:8m4ol7$cn@dispatch.concentric.net...
Toll,
I am surprised at your 120 amp load. I have a 667 that will do approx 800
watts on the bench and according to #12 it pulled 65 amps. I had Sean check
it and the 800 was a good number but he couldn't measure the amp draw. Are #
12's amp reading's off?

Before you buy.

9. exportradios, a good place to buy?

Newsgroup: rec.radio.cb
Date: 2000-08-01 00:00:00 UTC
From: nick250@aol.com
Message-ID: <20000801025223.07847.00000041@ng-fa1.aol.com>
Source record: 46456

Does anyone have experience or knowledge with exportradio and their "tuned and peaked" and "supertuned" CBs? They charge $20 for the tuned and peaked, and $50 for the supertuned. I am thinking of a Uniden PC68XL ($89). Do they do what they say and are they reliable? I would rather buy locally if I could find a place in eastern mass that provided those services (would even pay extra for being able to deal locally and face to face) but so far have not found any shops who do. TIA, Nick

10. Who is John Corky Mackey

Newsgroup: rec.radio.cb
Date: 2000-08-01 00:00:00 UTC
From: Anon <anonymous@cotse.com>
Message-ID: <200008010738.DAA16333@anon.cotse.com>
Source record: 46457

John Mackey, barely a boy was born on a reservation in Iowa. He attended
East High School where he was the constant target of abuse by all his
classmates and shunned by his teachers and the school administration. As a
child he was know to the authorities for a broad range of deviant behaviors.
He was classified as a sexual offender and had to move to Oregon in later
years. John is a nurses aide and works for an agency dealing in mental
patients. John spends most of his time driving to sights in Oregon and
Washington to empty bedpans. He used to be active on Fidonet but then had
to leave when the scanner echo moderator and John's BBS operator removed his
access for acting as he does on this NG. John holds the record for off topic
posts to this NG, 389 in one month. Most of these posts were made in the
process of stalking Bill Cheek. John has been booted by many ISPs and BBSes.
Even now he tries to lure the newbie into thinking parg.org is the place to
send complaints when @Home is his ISP and the place to report abuse. In
1999 he was briefly held by (federal) authorities regarding the sale of
Amateur Radio licenses. (He has admitted to other legal problems in the
past, also) He is the owner & operator of no company, has never produced a
book or any information of any use. He is known for destroying a repeater
and power supply after he reversed the polarity during installation. John
probably bought his ham license, even thought the answers to the test are
published on the net and in many books. John has never served his country in
the military due to his criminal history. John Mackey is not known by any

the radio community being he has never contributed
anything. Most people
feel his technical knowledge is zip, most people feel all
aspects of his
personality are sick and demented.

Nonsense!
A splitter is just a combiner in reverse... Try reading the Motorola RF Data Manual. It says that exactly!
Where do you come up with this rubbish?

Well... that would be closer... but I've yet to see that ratio used on a 4pill. Anyway... that's really not a good way to do it because of the high leakage inductance in high ratio transformers of that type. They should be combining/splitting to the 50 Ohm standard and stop trying to cut the costs to the bone.

Message-ID: <3986C6BD.40F22896@aol.com>
Source record: 46474

Hi all, was wondering if anyone out there would have some info on a
Lafayette
cb radio Micro 723. It powers up, lights up, some noise in the
speaker,squelch seems to be working but no real sound coming out of th
speaker. Checked the
mike voice coil, and it seems to be open. Would this prevent the unit
from putting
out sound? And what would the resistance of it be? Could use a schematic
for this if anyone could part with one. Thanks.....

28. Got any "Classic Cheek" archives to share with the group?

Newsgroup: rec.radio.cb
Date: 2000-08-01 00:00:00 UTC
From: toomanyradios@aol.com
Message-ID: <20000801094527.04397.00000192@nso-md.aol.com>
Source record: 46475

Just had a great idea...you know how "Classic Peanuts" comics are being rerun, following the death of Charles Schultz?

How about "Classic Cheek?" You know...all the great Cheek one-liners from the early days of this newsgroup. Or, even back to the dark days of Cheek vs Mackey on FIDOnet.

Certainly someone among us has archived and stored all those great "Cheek-isms" of yesteryear...Cheek calling Mackey a "horse's arse" and Mackey returning fire with descriptions of his adversary such as "Butt Cheek."

Got 'em? Share 'em! Post 'em here!

The marine radios work on VHF (over 156 MHZ, approximatly), and the CB, is evident that works on 27 MHz. It's impossible use the marine like a CB. The max output of marine equipment is 25 watts.

I think that it's better leave the marine VHF to usefull applications on the sea. For example, there're a lot of channels only for especific use, like the 16 (int. S.O.S.), the 85 (coast guard), etc. And normally the proffesional fishers ever use one channel for them.

true mobile51 but you don't have break the coil to cause tvi when you spead the coil open it will give you more watts (1 or 2 more). Spreading the coil(inductor and that all it is)you allow more harmonice to enter the 54mhz band the best thing to do is check the inductor(or coil) to see if it has been play with. If it has get some one to look at it and get it fix if you are not sure how to do it. and leave it along. a lot of people that do mod(I am talking about people that don't know what they are doing)to redios do this,i have seen it in radios and seen people do it. but that don't make it right that they do it but they do.

I have a Yaesu FT101ee radio for sale.....It has the Am filter, and fan,and all crystals are installed,and yes it is ready to talk on the 11 meter band. I also have the yc-601 frequency counter that goes with this radio,It is a beautiful frequency counter that works perfectly.Both the radio and the frequency counter are in mint condition. Also with this station comes a Demco Modulator and 2 microphones.
Also to compliment this station, I am selling the Yaesu fc-301 antenna tuner which is in brand new condition, and I have the Yaesu Landliner which is some kind of phone/speaker patch or something.

I am selling this complete station for $600 plus shipping to zip code 08360.....PLEASE ONLY SERIOUS INQUIRYS.

You may email me at worldwide503nj@aol.com

43. High SWR readings??

Newsgroup: rec.radio.cb
Date: 2000-08-01 00:00:00 UTC
From: Charles Stoyer <cstoyer@interpex.com>
Message-ID: <jiEh5.23991$jm5.564354@news-west.usenetserver.com>
Source record: 46490

I have a cabin running on 12V and a base-station antenna. The antenna is about 12 feet long and mounted on a metal pole about 10 feet above the steep (18/12 pitch) metal roof. There is about 30 feet of RG-8X cable that came with the unit and I have another piece of cable (about 15-20 feet) running from the CB mount inside the cabin to the RG-8X cable. UHF connectors and a splice (Radio Shack) are used to connect the 2 cables.

When I take the CB outside and connect directly to the RG-8X, I get a SWR of about 1.3 or 1.4. When I connect it through a piece of RG-58U, I get about 3, and when I use RG-8M I get about 2.5.

I am using a Radio Shack SWR meter.

What am I doing wrong?

Thanks in advance, Charles.

45. Help: Uniden PRO340XL Walkie Talkies Schematic/Mods

Newsgroup: rec.radio.cb
Date: 2000-08-01 00:00:00 UTC
From: acheqa@my-deja.com
Message-ID: <8m7944$b7g$1@nnrp1.deja.com>
Source record: 46492

Does anyone have info on what to tweak or adjust or mod on these Unisen PRO340XL wlakie talkies? It says they are rated for 4 watts maximum output and I measure a hair less than 1 /2/ watts output with only 30% modulation maximum. These are refurbished units from a guy selling a whole bunch of them on eBay. They also appear to be an older discontinued version of the PRO340XL and are not the exact same as the current Uniden PRO340XL's that have AC adapter and rechargable batteries plugs on the side of the radios. Mine do not have this capability. Mine are only 8 Alkaline batteries powered.
Cheap radio, nevetheless I want to peak it up and need the schematics or PC board components location info.

Thanks if you have info on this. (And Please don't respond and tell me to get a better radio, I have a purpose and need for using these).

Sent via Deja.com http://www.deja.com/

Here's the e-mail response that bounced:

> Is there a book where I can find out about the modifications?

There are plenty of mod books, but they aren't cheap.

> Or should I take
> it to the truckstop CB shop, and pay for the peak and tune?

If you think you can do it yourself--do it yourself.

Which radio is it, and what mods do you want? There
are websites and mailing lists that have mods and
people willing to help you through the mods.

They're talking 800 peak watts out.

The DC input wattage is average.
The amps average output wattage was
far less than 800.

It adds 12 meters to the radio.... not too much use unless you have a
ham ticket.

> 3, and when I use RG-8M I get about 2.5.
>
> I am using a Radio Shack SWR meter.
>
> What am I doing wrong?

Sounds like the actual SWR is high and the different coax
lengths are causing different readings.

There are a couple of approaches you could take. The
most straight-forward is to measure the SWR at the antenna
feedpoint (the antenna end of the coax rather than the
radio end). Adjust the antenna until the SWR is 1.5:1
or lower. Then the coax length won't effect the reading
(unless there is something wrong with the coax or connectors).
The other approach is to cut the coax to a whole number
multiple of a resonant half-wavelength. With the coax
cut that way, the SWR reading will be the same at both
ends unless the SWR is very high and the coax is very
lossy. In that case the SWR will be somewhat lower at
the radio end. I prefer the former approach. Resonating
the coax is likely to be a waste because all it does is
verify what you already know--that the actual SWR is high.
Resonating the coax doesn't fix the underlying antenna
problem. An old trick is to add a length of coax to an
existing run and recheck the SWR. If the reading changes
you know the line isn't "flat" and there's a mismatch at
the antenna end. By accident, that's what you've done.

> Thanks in advance,

You're welcome.

If you want to resonate the coax, here's the nuts and bolts
of how to do it. (The easiest way in your case would be to

cut the run coming from the antenna (originally about 30 feet)
to 27 feet 2 inches.)
--
Here's the formula: 492 times the velocity factor (in decimal
form), divided by the frequency (in MHz).

The velocity factors for popular coax are:

.66 for solid polyethelene dielectric RG58, RG8, RG213 and
RG214.
.75 for foam polyethelene dielectric RG8X and RG8M.
.80 for foam polyethelene dielectric RG58 and RG8.
.84 for air space polyethelene dielectric 9913.
.85 for LMR-400.

Using the formula we get these resonant half-wavelengths for the
different coax types (frequency = 27.185; Channel 19):

11.945 feet for solid polyethelene dielectric RG58, RG8, RG213
and RG214.
13.574 feet for foam polyethelene dielectric RG8X and RG8M.
14.479 feet for foam polyethelene dielectric RG58 and RG8.
15.203 feet for air space polyethelene dielectric 9913.
15.383 feet for LMR-400.

To convert the decimals to inches multiply them by 12:

11.945 feet = 11 feet, 11.34 inches.
13.574 feet = 13 feet, 6.89 inches.
14.479 feet = 14 feet, 5.75 inches.
15.203 feet = 15 feet, 2.44 inches.
15.383 feet = 15 feet, 4.60 inches

Rounding up to the next closest inch is close enough:

12 feet for solid RG58, RG8, RG213, and RG214.
13 feet, 7 inches for foam RG8X and RG8M.
14 feet, 6 inches for foam RG58 and RG8.
15 feet, 3 inches for 9913.
15 feet, 5 inches for LMR-400.

> Happy
>
.....

from Mobile 51
Its also possible that someone did the 50 ohm resistor/ diode swing mod which
> will make it bleed like a bandit, but key lower and swing higher.

52. FS: RCI 2970, TX 1200 and other equipment

Newsgroup: rec.radio.cb
Date: 2000-08-01 00:00:00 UTC
From: "Mr. Breeze" <mrbreezej@netscape.net>
Message-ID: <398616F2.A045C9D5@netscape.net>
Source record: 46543

Hello all, I am selling all of my radio and test equipment. Here is
the list:

1. One RCI 2970 10-12 Meter radio; 50W AM/FM/CW 100W SSB $250
2. One EC 2018 Road Noise Turbo microphone Included with radio
3. One Texas Star 1200 amplifier AM and
SSB $300
4. One Workman 2K Low Pass
filter SOLD
5. One 24VDC 1.5F
capacitor
SOLD
6. Two Radio Shack external
speakers $5 ea
7. One Super Penetrator mobile
antenna $20
8. One 6" spring included with antenna
9. One 3 pad magnetic mount with 14' of RG8U 95%
shielded $20
10. One DAIWA Cross-Needle power/SWR meter 2KW max range $100
11. One Radio Shack 3A power
supply $25
12. One Radio Shack Frequency
counter SOLD
13. One 300 W MFJ 260C dummy
load SOLD
14. One 1.5KW MFJ 264 dummy
load $40
15. One 60A DAIWA power
supply $150
16. Assorted electronic parts in storage drawer
cabinet SOLD

All equipment is like new, REALLY. I take care of my equipment. The
radio and the amp are 6 months old.

John

P.S. I also have a 100MHz O'scope that sometimes works and sometimes
doesn't. It looks like a power supply problem that I was too lazy to
fix and now it doesn't really matter. It is a Textronix with all
manuals. Make me an offer if interested but it will probably cost more
to ship than you may be willing to pay. So, if you are in the Metro
Washington
DC area you might be interested in picking it up.

Bought my Cobra 75 WX ST about 6 months ago. Its great, I installed it in a 99 Grand Cherokee, put the control unit in the center consule, drilled throught the arm rest for the mic jack. Compact and easy to install, and when in the rougher sections, just unplug it and toss it in the glove box. It works pretty well, used it off roading and didn't miss a trick. Got it on-line at VALCO Electronics for $89.99, cheapest I saw locally and on the web.

E-mail me if you has specific ????'s

Source record: 46547

I recently purchased a PC68XL and I am looking for a good shop in the Greater Boston area (or even eastern mass for that matter) to "tune and peak" it, and possibly add amp. I understand about having a good antenna is crucial to the mix. I am using a K40 mag mount and it seems to work well, though if I was convinced it was superior I would change to a Wilson. I want to stay with a mag mount for now because I will be changing cars soon, and I dont want to drill any holes in the car. TIA, Nick

Source record: 46550

Yes... davemade and xforce are doing it that way... and that's just my point... they're doing it wrong!
On a 2879 push-pull amp there is about 5 ohms impedance from the output of the two devices. A 3turns(9 x 5=45) transformer will only transform to about 50 Ohms. The power combining setup they're using requires a 100 Ohm impedance because they're not using the 2:1 transformer that is required in that arrangement. So in essence what they are doing is matching a 50 Ohm port with a 100 Ohm port. That's a no no...

Now I posted a picture of Henry amplifiers... he's doing it right!

Source record: 46552

I bought the chipswitch for my HR2600.It adds a lot of nice
features,most of wich I don't use.I'll make use of the memory options
but the main reason for buying the chipswitch was to add 11meters.The
stock chip in this radio wouldn't allow modification and I couldn't
get my hands on an older chip.Over all,I'm happy with my purchase.If
your not skilled in soldering/desoldering on doublesided and thru-hole
circuit boards,I wouldn't advise trying to change it yourself unless
for some reason your radio allready has a socket installed.You could
easily destroy the radio.I don't know if they improved the sockets
that they sell specifically for the chipswitch,or if I just got a
krappy one.It takes an awful unusual effort to seat the I.C. into the
socket,and in a mobile application,they have been known to work their
way out of the socket.
I have access to a desoldering station wich helped me to remove the
old chip without destroying things.
Good luck

In your picture you have a multi-port splitter, and yes the transformer is
also visible, But that is not the only way to effectively use a multi-port
splitter. Don't ask how either, find it in the RF Handbook, if you can.

I tried
> turning down the RF power but I still get it. Any suggestions? thanks

I had the extra channels put into a 148 GTL and was running it into a
PDL-II beam at 48 feet and it destroyed everything(TV, Phone, stereo,
and probably some other things that were not brought to my attention)
within a 3 block radius of the house. They never alligned the radio
after they put the kit in. Went to a HR 2510 and had no problems at
all even with a 200 watt tube amp. Clean as can be.

Maybe output matching, will cause excessive heat,but not input matching. If
you have unusually high amounts of current draw they will get hot, this
could happen with too much collector to collector capacitance or too much
output shunt capacitance, but proper use of a current meter, scope,
wattmeter and spec analyzer is more efficient than assuming a bad match will
cause excessive heat, or saying using a combiner without a matching XFMR.

This is another example of why its hard for newbies in the CB world to get advice on here...Somebody asks a question which requires an answer like "Try shortening your whip length 1/4 inch at a time" and instead they get an answer from the Professor or others like "You`ll need to change the mean wave amplitude on the horizontal plane to a frequency at a resistance of 50 Ohms to achive a correct correlation of velocity to carrier efficiency"

I hope I did`nt brain my damage.

If you had bothered to read the Motorola RF Data manual... you would see
both type of combiner/splitters. They both require the 2:1 transformer!

Agreed... but a poor input match will result in a poor power transfeer from driver to amp!

You are correct... but the matching is very important! Xforce, DaveMade, Texas Star, and others are shortcutting by not using the 2:1 transformer and are sacrificing efficiency and increasing the heat/strain on the devices by doing so. This is not good design practice... but since they don't guarantee the transistors... they don't care.

I guarantee that once you increase the power wires, and increase the
internal current capacity of the grounds, a stock alternator will
not handle the amp. On rainy days, with everything going, my 125 amp
alternator has a problem. Oncoming traffic must think I'm flashing
my lights at them on SSB!

I have the following stuff for sale:

Please email me only if you have any interest.

1. HR-2510 w/Chipswitch - AM,CW,USB,LSB,FM Fair cosmetic
condition. Appears to be functional. No mic. $125
2. HR-2510 w/Stock Mic. - AM,CW,USB,LSB,FM Very good cosmetic
condition. Fully function tested. $175
3. Realistic TRC-492 Navaho Base - AM only. Fair cosmetic
condition. Appears to be functional. $35
4. Murch UT-2000A Roller Inductor Transmatch - $75
5. MFJ-971 Antenna Tuner/Watt meter w/cross needles - $50
6. Shure 526-T Preamp desk mic. $40
7. Astatic D-104 Silver Eagle preamp mic - Just refurbished by
Astatic. $70
8. Johnson Viking Challenger AM Transmitter w/Johnson Model #122
VFO plus 2 extra 6DQ6 final tubes. $110
9. KRIS Power Pump 6-15 meter linear amplifier. Good condition.
Uses (2) 6LQ6's. $125
10. Heathkit SB-220 2KW amp. 10-80 meters. Tunes up fine. Hasnt
been seriously tested on other than 80 meters for some time.
Wired for 220V. $600
11. Heathkit HM-2140 SWR/Watt Meter 2KW capacity. $50
12. Heathkit HO-10 Monitor Scope - Lights up. No vertical
resolution. I think it needs a new 12AX7. $30

What type splice it this? Is this a coax adapter that has a double
SO-239 type in line, threaded type connector, where the coax connectors,
that are called PL-259 connect to? Or are the wire spliced together like
you would do with the lighting wires on a boat trailor? Not sure what
you mean by splice.

> When I take the CB outside and connect directly to the RG-8X, I get a SWR of
> about 1.3 or 1.4. When I connect it through a piece of RG-58U, I get about

> I am using a Radio Shack SWR meter.
>
> What am I doing wrong?
>
> Thanks in advance, Charles.

Well Charles you didn't tell us how your using the SWR meter. I have
seen a lot of coax not properly soldered to the PL-259 (male)
connectors. Which causes a lot of problems. Are the connectors all
soldered properly?

My neighbor has come to my door twice, complaining that my CB is causing static on her cell phone. I don't see how this can be possible, aren't the two operating in different realms? I've kept my radio tuned up so I won't cause "bleedover" and this is the first complaint I've heard of like this. Is it possible or is she mistaken? I don't use a linear or anything other than just the old radio and I don't use it that much anyway, can't hear anything in town.

I don't know how you can say that peaking a radio from 4 watts (standard) to the mid 20's and beyond (depending on the radio) is not an improvement. Along with that power increase a good tech will maximize the modulation and adjust the receiver among other things.

Besq,
Well, the first reason is probably your antenna, 'cuz she
can see it, and naturally, you gotta be the one interfereing!
It's possible for ~any~ radio to cause interference, but the
likelihood of a CB radio causing interference to a cell phone
is so slight, you stand a much better chance of winning the
lottery. Amplifiers, etc, would make very little difference
in this case.
Tell her you understand that the phone company is in the
process of putting in new cables and that's probably what's
causing the static... (is she blonde?)

Charles,
You appear to have an antenna that isn't 'matching' the feed line.
You 'cure' that by making sure the antenna is resonant (adjusting it's
length, or if it has some tuning device by adjusting it). That should
result in a good SWR between antenna and feed line. It's always
better
to have a single 'run' of coax between antenna and the radio, but,
that
doesn't happen too often. A 'splice' isn't always a 'bad' idea, but
don't use them unless necessary.
One word of advice, throw the RG-8M cable away! It's made for
audio use, not RF, and has a very high loss factor. That shouldn't
affect
your SWR at all, but it can your signal. 'Used' coax is almost always
a bad idea. You never know what's been done to it, and how it's been
used. You may be getting someone else's problem.

I have the following stuff for sale:

Please email only (not post) if you have any interest.

1. HR-2510 w/Chipswitch - AM,CW,USB,LSB,FM Fair cosmetic condition. Appears to be functional. No mic. $125

2. HR-2510 w/Stock Mic. - AM,CW,USB,LSB,FM Very good cosmetic condition. Fully function tested. $175

3. Realistic TRC-492 Navaho Base - AM only. Fair cosmetic condition. Appears to be functional. $35

4. Murch UT-2000A Roller Inductor Transmatch - $75

5. MFJ-971 Antenna Tuner/Watt meter w/cross needles - $50

6. Shure 526-T Preamp desk mic. $40

7. Astatic D-104 Silver Eagle preamp mic - Just refurbished by Astatic. $70

8. Johnson Viking Challenger AM Transmitter w/Johnson Model #122 VFO plus 2 extra 6DQ6 final tubes. $110

9. KRIS Power Pump 6-15 meter linear amplifier. Good condition. Uses (2) 6LQ6's. $125

10. Heathkit SB-220 2KW amp. 10-80 meters. Tunes up fine. Hasnt been seriously tested on other than 80 meters for some time. Wired for 220V. $600

11. Heathkit HM-2140 SWR/Watt Meter 2KW capacity. $50 12. Heathkit HO-10 Monitor Scope - Lights up. No vertical resolution. I think it needs a new 12AX7. $30

Wrong. RG-8M is no higher loss cable than 8X. As a matter
of fact, they are the same exact cable.

Both have PVC jackets of the same diameter. Both have 16guage(19x29)
stranded inner conductor.. Both have identical stranding of the bare
copper shielding. Both have the same foam polyethylene dielectric.

Losses of 8M are stated to be2.2db/100ft at 50mhz
Losses of 8X are stated to be 2.5db/100ft at 50mhz

Obviously you are not establishing a proper counterpoise. The addition
of this ungrounded wire and the change in SWR confirms it.

>Shouldn't I be able to just mount the antenna, tune it and that's it? Why am I
>getting crazy SWR's when I shouldn't? Thanks.
>
>PS- the length of coax from the antenna mount to my radio is about 7 feet.
>Thanks.

If you are not establishing a good counterpoise (from the above) then
the use of 7 foot of coax could be a problem. The RF is not smart
enough to be able to tell the difference between using the coax or
using the roof as a counterpoise. Throw a barricade up by choosing a
length of coax that would be most difficult for counterpoise use. At
the same time this length creates a voltage null at the radio/swr
meter that should improve the reading.

18 feet!

Then continue on by finding a better way of establishing a roof
ground. This should make for an adequate counterpoise and improved
reading.

I would continuity check the base of the antenna with the chassis of the vehicle and check for shorts/open there. Make sure that your roof mount is grounded to the roof.

Do you have a different vehicle/mount to try and verify that the antenna is good?

While that much of an increase will make some difference AM is such a power hungry mode and inefficient for distance. It will help some but unless the bias of the finals is done correctly will much more likely make the quality worse via distortion. Sure changing the finals might help and actually. Hams talk all over the world with 100 watts regularly and some up that to 1000 watts, 2000 peak but still SSB. Ironically the trend in Ham Radio among hams is to talk the furtherest with the least power .. called QRP in most circles. The purpose of my answer was to say the KEY to good quality is in the percent of Modulation rather than the amount of power. Power will just get you further but Modulation and keeping the mod waveform good makes you sound better.

Even with 1000 watts AM will lose much in the carrier and given the propagation, time of day etc will be louder but at what cost? Splattering, Distortion if not tuned properly, making you top dog in the hunt? If it's a power issue of being the top on the pile then power will do that locally however at what costs?

Could be that what he is using for the splice is bad. Seems like the first 30ft are good. I wouldn't think both cables he tried were bad but it could happen.

i think she mean her portable phone , not a cell phone like a car phone , and older models of the portable phones can very easy get bleedover . if you ask he what kind of phone she has , i would put $ on it that is not a new phone . i have a uniden 900mhz phone , and never once have had bleedover from any cb or ham radios , which there are a few on my street

Impedance transformation is not purely a matter of calculating a turns ratio.
The wires in the transformer also act much like a linear transformer(using a
piece of 70 ohm cable to match 100 ohms to 50). This effect the actual turns
ratio a bit. Most of this amps were designed by trial and error redesigning the
transformers until they worked best taking off a turn or adding 1. I would not
bark to loud unless you can redesign one and prove yours works better. Also

assume the transistor impedance may be 6(not an unrealistic number if the amp is 0 biased) instead of your 5. While the turns ratio may still be too low adding another would make it just as bad on the other side of 50. The only way you are really going to be able to tell is to get an amp and redsign the transformer to see if your idea works better. This is one of the problems with amps like these. The output impedance may be too low but you add a turn and now it is too high. These amps need some kind of final adjustment to bring the output impedance to 50 ohms or whatever is best for the installation. I can't imagine that someone designing the amp would not try a few different turns ratios before they decided on the one that worked best regardless of what the numbers they cranked out read.

Disconnect it for a week and ask her to come over when she hears the static.
When she does show her you have been disconnected to service the radio and
not to bother you anymore.

103. Hi SWR's w/Wilson 5000? wire fixes it though

Newsgroup: rec.radio.cb
Date: 2000-08-02 00:00:00 UTC
From: notdareal@aol.com
Message-ID: <20000801222936.20943.00002647@ng-ch1.aol.com>
Source record: 46594

OK, I got a Wilson 5000 (center coil loaded) mounted dead center on the roof of my van. It is mounted on a Firestick "Beehive" style roof mount with a spring. No matter what, I get high SWR's. I tried everything. Checking for shorts, checking coax, tuning the antenna. nothing. However, get this, If I attach a piece of wire (about 55") between the base of the antenna and the roof mount, and just let the wire lay there on my roof, I get about 1.5-1 SWR. If I touch the other end of that wire to ground, my SWR's go back up again. What gives? Shouldn't I be able to just mount the antenna, tune it and that's it? Why am I getting crazy SWR's when I shouldn't? Thanks.

PS- the length of coax from the antenna mount to my radio is about 7 feet. Thanks.

What is a galaxy 73V capable of putting out with just a 11 meter mod. The power meter in mine swings up when I modulate but the external power meter swings back. Could that be because its pluged in the cigarette lighter. I did that so I could move it from car to car when needed.

Thanks in advance,

I wouldn't worry about the length of the coax, that's not the
problem.
When you say connect the wire at the base of the antenna, do you mean
between the antenna and the mount, or between the mount and the roof?
If between the antenna and the mount, I would think that the wire is
acting as an antenna, or as a 'capacitive hat'. In either case, it
means
the antenna is not 'right' for some reason. Who knows, bad loading
coil
maybe? The problem lies in the antenna or the mount to roof
connection.

'J.D.',
It doesn't have anything to do with the cigarette lighter
power connection. It means the '11 meter mod' was done incorrectly.

Take the spring off, or cut the whip by the same length as the hight of the spring. You're lengthening the antenna by 4-6" with the spring, and that will throw the resonance off enough to show a high SWR... The wire you're adding is probably causing a secondary resonance, fooling the radio into thinking it has a more resonant antenna than it does... It won't get out nearly as well with the wire as it will with a properly tuned antenna.

Sorry that you have not read the prevoius posts well...

We are talking about the power combiners/splitters missing the 2:1
transformer in the 4pill arrangement.

Message-ID: <8m90g3$7cv$1@nnrp03.primenet.com>
Source record: 46626

I have a Delta Force with the stock mike and it has more audio than I can use. I run the mike gain around seven to eight o'clock to keep the engine noise out of the radio when I spin the alternators. If you are short on audio have the radio put on a scope and lock it at 100%. The only thing that's been done to my radio is the frequency mod and the RX mod.

"Modulation and keeping the mod waveform good makes
you sound better."

That along with a good power tune will prove a person with a very useable
radio.

My guess without being able to look at it, would be the mount. I haven't seen any Wilson antennas go bad, even though it is possible. Are you using any amplifiers in your setup? Check the connection between your antenna base and the ground on your vehicle. Your base might be grounding your antenna out. As for the length of the coax, that will not affect your VSWR. It will change the reading on your meter however. Being you are going into the base and it is easily accessible, I would place your SWR meter directly at your antenna base. This will give you your most accurate SWR reading. If the SWR meter is placed anywhere else inline, its reading will change, but should only change slightly. If there is a drastic change then the coax probably has a bad spot in it. Speaking of coax, it is generally best to go in multiples of three and this is just a rule of thumb. Different types of coax have different velocity factors, which changes its electrical wavelength. Therefore you can't say multiples of 3 is standard length. I hope you get your rig back on the airways. Hope some of the info may help.

I've been interested in checking out his software for quite a while, I think since it was V2.0, however I end up reformatting my hard drive at least every 6 months, I refuse to buy software that i CANNOT reinstall without going through the Extreme measures he has imposed, If all that is required on his latest version is a hardware dongle I may purchase it.... Otherwise I will pass again! Hopefully Carl will rethink, or has, because I think the security measures puts off more folks than he realizes....

Hamm, I believe you have hit the nail right on the head....the wire used to wrap the transformer will also change inductance there is no in between turns ratio, adding or removing a turn may not be the thing to do.. when the professor can make some improvements perhaps people would listen to him. I also think dave has done his homework on these as well as #12 who has also gone over the amp... And i know the professor couldnt hold either one of there jocks when it comes to rf ..
Perhaps he could tell us the correct turns ratio instead of telling us they are wrong

"Hamm4fun" <hamm4fun@aol.com> wrote in message :

> Impedance transformation is not purely a matter of calculating a turns ratio.

Here comes the old "adjust the length of the coax to change the swr" myth.
Leave the length of your coax alone, it has nothing to do with the swr.

I agree KW, I bought the 3.5 version and found it pritty handy
for getting voltages on different parts.. but when I bought a
new computer I couldn't transfer it to the new machine so I lost
it all and it turned out to be a waist of money....I don't
intend to buy the new one just to have the same problem...
don't misunderstand me. I think its a VERY good program and very
easy to use. but I have two shops and end up changing or
formatting computers quite often..... it not for me..

Want to Mod Cobra 21XLR (upd858) for low Freq only. Don't have Sams #121. I have Mod.s for High and Low With 2 switchs, but this is a AM only rig should only have low Freq.s (got to many dummies with AM on SSB freq.s already and visa versa), should be more easy with low freq.s only, hope to use CB/PA or ANL switch. This should make a fine old low freq. rig. I will drill and add 2 switchs if I have to, but would much rather switch one or two pins on the chip using one of the above switches. Thanks for any advice. 738

So are you saying that a 4 pill configuration like the DaveMade 4 pill is not working because he did not use a matching XFMR? What kind of test equipment did you use to find this out? Keep in mind that books are written by people who experiment. To properly do this you must have the proper test equipment, what test equipment do you use to figure all this out? With a name like professor you must have a fully equipped bench.

That model, (I think) has a weird mixing scheme.
If it mixes down you can indeed go below
1.

Not a popular radio in its day because
of limited space.

You would do better with other models
from that era; 89XLR,138/9XLR, The President
line.....

beaker,
Sure, 'cordless' phones are a different story, the 900 Mhz having
'less' of a problem with interference but still not immune to it.
Having 'been there, done that', and even going to court twice about
Part-15 devices, I tell them 'sorry, but read the sticker on the
bottom of the phone'. It's their problem, not mine.

With the capital letters I got a "file not found" error.
With the small letters I pop right over to it.
That's why I worded my comment the way I did; for some
people the caps version will probably work, while others
may get an error message and be left wondering why.
It would be a shame to lose potential hits to your site
due to something as trivial as that.

Message-ID: <39888502.1C94@bellsouth.net>
Source record: 46658

Hey, Group!

I am posting the following just as info. I know some people must like the K40 antennas or they wouldn't still be around. I have no interest in this company at all, and I couldn't care less either way, so don't flame me! LOL! If the info is useful, you're most welcome. If not, just ignore it. OK?

Subject: Antennas & Current Specials

We now carry the full line of K40 CB and 10 meter antennas!!!
K40 $39.95, K30 $22.95,K40 Trucker $46.95

==========

Current Specials:

Alinco DR140TQ 2m 50w mobile $149.95...Closeout good until stock runs out.

Alinco DJ195T 2m 5w HT $125.95...Closeout good until stock runs out.

Daiwa CN101 Cross needle meter 1.8-150 Mhz $79.95...Good through 9/10/2000

ADI AT600HP refurbished 2m/70cm HT $199.95...Good until stock runs out.

Garmin VHF720 Marine band HT $119.95...Closeout good until stock runs out.

Thanks!!!

Simple.

The output of the transistors transformer is not 50 ohms.

The combiners will do a 2 to 1 conversion. Therefore, you get 25 ohms to each transformer.

Usually see 4 turns on the box.

That gives you app 32 ohms out of each transformer, and combined, you get 64 ohms.

Then, they pad the output with enough Xc to APPEAR to have dropped down to 50 ohms, and the VSWR reflects that.

Some of the mowatts and xforce boxes I have heard actually use a LC circuit on the output to give a true 50 ohms.... So do the larger Messenger amplifiers.

Bottom line, you get what you pay for.... Buy older Messenger, and you get a tank. Buy the shit boxes of today, and get... Well, shit.

They are IN PHASE.

A transistorized (and most tube) amplifiers invert the signal 180 degrees. Since a driver inverts the input 180 degrees, and the subsequent "final" set of transistors inverts 180 degrees again, you end up with 360 degrees of phase reversal, or in other words, the same thing as what you started with.

Couple that with an amplifier that has 17 to 20 dB of gain, and you have a LOT of chance for regeneration.. AKA oscillation.

Or you are using class C, small gain amplifiers.

Their is a reason the 2 pill drivers in a 2X4 don't put out the same as a straight 2 pill... Because they don't need it, and don't have the gain.

Guess you never saw a bone stock Palomar 16 pill, or Messenger 16 pill, or the Texas Star 3200, or a myriad of NON-BATTLE-BOX Class AB or B boxes, have you.

Stick with the Class C splatterbox junk. It will suit ya well. The low gain will continue to let you run the shit out of them.

Source record: 46664

I can't say wether they are off or not, as I can't see what he is using.

I know that I put two 40 amp fuses in parallel to power my 667, and it blows them every damn time, in a matter of minutes (AM use.... SSB, and it goes all day long).

I put a 100 amp fuse in line.. No more problems.

Also, it depends on the voltage you run. The higher the voltage you run, the more amperage the transistors will pull (Professor wrote a nice post about this about a year ago/year and a half ago).

I run mine at app 15 volts.. Mebbe 15.5 on some days, when the wind is blowing just the right way... I have also increased the amount of R in the bias circuit about 10 percent, so I don't have the problems with the shitty bias diode-clamp system running away, or letting .9 volts on the base of those 2879s.

He is talking about PEP power.

Most ALL ammeters you find will be AVG type meters.

Big difference, to the tune of about 40 percent in some cases.

Elementary, my dear watson.

Newp.

He is using a PEP wattmeter, and using an average ammeter.

You should, and do, know things like this, Brian.

A lot has to do with the voltage levels involved, too. As the voltage
increases, the current draw goes up exponentially, too.

You need 20 amps worth of alternator for every transistor in your amp.

Using a 2X8, and want one alternator, a 165 leece will barely run it.

Better off running the 2 pill off the truck alternator, and having a
seperate alternator for the 8 pill

True.

I would say probably near 1400.00 for a Class AB amp.

A DaveMade or Cookie or other battle box is closer to 1200.

No. Usually the input of the second stage is STILL 50 ohms.

If it isn't, I change the input tuning to accomodate it.

Just because I hang in a CB newsgroup doesn't mean that I can't get out the
calculator and figgir this stuff out :)

I'm not saying they don't work... only that they don't work as good as they
should because of the poor interface at the combiner/splitter.

I think the ones out there that really understand have gotten the point. As you know... many out there will argue forever with little or no knowledge about the subject. That's a shame. They should spend a little more effort and research the topic. That way they might be able to speak with more authority...

Sounds like (if the lady w/ the phone really is being interfered w/ by you)
you're sending out some harmonics along with your signal. Get a band-pass filter
from Radio Shack and see if it fixes it.

I agree that the impedance transformer ratios would have to be a minimum of
16:1 on a big deviced 4pill to be able to match properly... but I have never
seen this ratio used in modern day commercial boxes. I have always seen a
9:1 ratio used (example - Texas Star 500&667). This is not correct in my
book and may explain why these amps run very hot.

Thanks for all the replies. I think you hit the nail, she doesn't like my dogs either. She has complained when I haven't even had the radio on for days. I am always concerned about my neighbors but the little I understand about CBs, it just doesn't seem possible. CBs broadcast while the phones seem tuned to a specific receiver. It does seem like it would have to be in the same house and a powerful amplifier and off channel to boot to affect these phones. Thanks again, "I'm on the side". "Brown Eyed SQuirrel on the Money Mountain base" author of the "Ute Pass Carrier". KGK5314 or KMA1004, take your choice.

Sometimes. There is a couple people in our group that have AM only radios,
and we talk on CH32.

Should be the other way around (larger draw on SSB).

Texas Star doesn't use diode bias. Their bias circuit is just
a voltage divider.

> Toll Free

This had to come from an impostor.

That is about twice what the sweet sixteen needs, too

The sweet sixteen can be driven to near saturation, at 14.4 volts, with 125
PEP watts.

My 667 uses 4 turns on the output transistors transformers.

This is a impedance ratio of 16 to 1.

hrm.

> the better boxes use 3 turns ...

>>>Better? I hardly think so.

>>>On a 2879, the collector impedance at 14.4 volts is just slightly higher than 1 ohm.

>>>That means a pair is seeing 2 ohms... Couple that into a 4 pill, and you have an output resistance of 36 ohms.

>>>Hardly the 50 ohms wanted.

dont you think the cap across the
> transformer has an effect??

>>>Yes, but not in the transformation ratio of the transformer. The cap is their to cancel the L that is created in the transformer. L is an unwanted byproduct.

>>>Also, using a lower value of capacitance causes less current draw from the devices (more C = higher voltage, and the higher the voltage the collector sees, the greater the current it draws, be it rf or DC).

>>>The cap has NOTHING to do with the transformer turns ratio. The transformer ratio is equal to the square of the number of turns on it.

... and the guage of wire will also change the
> inductance

>>>Marginally. What effects the inductance most is the permeability of the ferrite used.

3 turns gives you 2 -100 ohms stages combined with a 2:1 combiner
> and viola a 50 ohm output... .

>>>Nope, 3 turns gives you 18 ohms on each transformer output. This would be ideal for a 6 pill, but not for a even numbered box.

>>>Nice try. Next time, think things through, though.

By using an intermediate "image" transformation network between the output network and the antenna, comprised of L and C.

Same thing you use when designing a Pi-L network on a tube.

No, if you look, they are NOT stepping each output transformer at 100 ohms.

That would mean that they would need a 50 to 1 transformation ratio, and
THAT would be about 7 turns.. A far cry from the 4 to 5 turns that are
commonly found on todays linears.

Even when volted, you don't see 100 ohms.

And the combiners are designed to see HALF the impedance you want on the
output, not DOUBLE.

They effectively ADD the impedances together, not subtract them.

You would need a pair of batteries bud. To split up the alternators amperage output.

The battery will get the shit charged out of it, from the constant hi-low pushing from the alternator.

It WILL work, but you WILL shorten the life of you battery.

However, you are thinking right... Just make sure it gets done ALL THE WAY!

Why waste your time keeping your alternator pumping all the time, with lower than wanted voltage, and killing the electric system (and shocks, springs, et all suspension) when you can hang one more, or a bigger alternator on the ride?

You can half ass anything, and it WILL work. But, I come from the skewl of do it right the first time, and never do it again (the Texas heat makes me only want to WORK on muh car as little as possible)

> Should be the other way around (larger draw on SSB).

You saying the duty cycle of AM is less than SSB?

The lower duty cycle of SSB allows the smaller fuses to work.

A fuse gets its rating by letting 200 percent of the rated current draw pass
for X amount of seconds (I can't remember the exact amount of seconds). The
lower duty cycle of SSB keeps the fuses from opening up.

> a voltage divider.

Your right... But my reasoning is the same. I still put bigger R in it,
and use a seperate R network for the driver.. This keeps the 2 boards at
the SAME level of bias, whereas the stock Texas Star bias scheme has the
driver and front board running from the same "regulator" for bias.

Muh house got broke into.

Lost my bird, all the slugs (near a thousand dollars right their), broke a bunch of linears, destroyed some ceramic tubes...

It was a mess.

I haven't had the radio on much since then... I am / was / still am fucking pissed.

Some kids, out on a dare.

Gee.

It seems to me that Bird had a digital meter a LONG time before Dave did, though :)

In actuality, that post was to do nothing but rile Prozac. I know what Dave made, and have seen it.

It is NOT a dupe of Dave..... I was just referring to the posts (albeit, bleakly) where Dave supposedly made all the strides in non-biased amplifiers and volting and his "folks" accuse everyone of copying them.

Hell, muh Skeleton 225 Texas Star runs fine at 20 volts, and has for years before anyone heard of Davemade.

So does my 3 pill Texas Star :) Betcha nobody ever saw one of THOSE!

I would suggest that you put the top 6 feet back on the antenna and try reading the swr again. If you don't have it, order a replacement or use Firestick's top loaded antron 99 whip. Might make a difference. ???

215. Galaxy DX 959 Frequency Counter Problem

Newsgroup: rec.radio.cb

I just received a new Galaxy DX 959 that I bought over the Internet.
It appears to be working all right, except fore some segments not lighting
up on the FREQUENCY COUNTER display.

Is this a common problem with this model? Should I return it
and get something better?

I know what you're saying big fella.I value
you're advise, you know that. But I have had
no problem with running my Messenger 1800
with minimal drop in voltage, and amperage
running my battery set-up. It may not be
competition, but it sure does a number around
this Bay Area.

The Landshark

P.S. It's a bitch to explain to the dealership, why
I have 2 alternators when I take the truck in for
warranty work.

Is it easy to open this particular unit, to get to the joints?

The rest of the radio appears to be working properly.
Have you seen a lot of LED panel displays failing
internally, or most of the problems of this kind caused
by bad soldering?

Toll, I give him credit for reading, but that is it. I doubt very seriously
he has ever tried to trouble-shoot and repair an amp that has 64 transistors
in it, probably never seen a power supply big enough to power one.

Chris, TW: thanks for help guys!

When I opened the radio it became clear what the problem was.
In the area close to the front panel controls there is a sandwich
of circuit boards connected one to another with pin connectors.
One of the boards got misaligned, so some of the contacts would
not be engaged. I aligned straitened up the board, and everything
seems ok now.

Sloppy design. If I had to put boards like that, I would at least
keep them in place with bolts and plastic washers...

I got a couple of these, probably from the same guy on Ebay. They are the older ones, and come in a box without any DC Car adaptors or anything.. with a Xerox'd manual. :-) No DC jack or Charger jack. Here's what you do... Go to your local electronics shop (I don't think radio shack has this). Its a 3prong DC power jack... Unscrew the unit, and look where the plugs SHOULD be.. there are simple solder points.. I soldered the proper part onto this area, and voila, I had the newer unit. Just drilled some holes/slots in the side of the plastic for the jacks. Works really well. Kinda pissed that the guy dorked me over like that. Don't think they are OLDER units.. I just think they are maybe like.. specially made for some kind of business application.. or something like that. you get my drift. Anyways.. if you need any help or wanna email me.. Give it a shot.. noid@involved.com

the better boxes use 3 turns ... dont you think the cap across the
transformer has an effect??... and the guage of wire will also change the
inductance3 turns gives you 2 -100 ohms stages combined with a 2:1 combiner
and viola a 50 ohm output... .

>

Yes that is daves design they are using exactly, 2 pill stages 2 wraps = 50
ohms combine as many of these stages as you want and use a LC network to
bring it back to 50 the lc is one of the secrets of why his bigger amps
run so well they are .. the lc is a 2 pole low pass filter which also
reduces harmonic output many of the other amp makers dont use this
design...

No he makes a digital reading 30 or100 micro amp watt /swr meter which can attach to any 50 ohm line section and use the plug in elements which can be programmed with his meter..
He doesnt work for Bird nor has he copied anything but he has done work for coaxial dynamics ....

Guess I'll throw my 2 cents in...

It's most likely a problem with that extra piece of coax. Don't believe those that tell you that your coax has to be a certian length - that's a bunch of BS - sure, at long lengths, you get significant loss, but at the distance you are describing, there shouldn't be any problem.

My suggestion is get one good length of coax instead of that 30 foot piece and a jumper - if you are running low power (stock radio?), then go with RG-58. It's cheaper and easier to manipulate. If you are running over 50 watts, go with RG-8. The exact brand isn't going to make that much of a difference at that length because the loss will be minimal.

ok professor, compare the input output impedance problems of solid
state amps with tube type mobile input and output impedance solutions.
Are the tube type mobiles more efficient than the transistor amps? when
i speak of tube type mobiles, perhaps shall we begin with varmint,
etc.,.......cd is out...................

You are one of a few people I have seen that spells it correctly. Kinda like what was used in the Cookie 32 to tie the 2 16 sections together, I know he doesn't have the coaxial wrap transformer like some of the commercial splitters but he does use the Wilkinson combiner. At least in the pic I saw he did.

mine only seems to go about 10 on a dead key and swings back when
modulating. When you increased the power did you have to do anything besides
adjusting it? I would like mine to stay at around 20 watts.

It's NOT an amp, it's power supply. And now that you advertised it, if I
was a good deal, it won't be for long...

Simple problem.

Whoever did your clarifier modification did it WRONG.

The MB3756 control voltage generator is getting shorted out.

Put a 250 ohm resistor in line with the lead going from the clarifier potentiometer to the MB3756 IC.

The symptoms you are seeing are the results of a hack doing the modifications.

Yepper!

And so does Messenger in their 16 pill.

Usually, you get better efficiency with this type of combiner, too.

The cap is just there for tuning out the leakage inductance of the
transformer... it has no bearing on the impedance transformation ratio.

How did you come up with the 100 Ohm level... new math? lol

Tube and transistor amps efficiencies has to do with class of operation and the circuitry used in the design... it has little to do with being a tube or transistor.

Input and output impedance are grossly different when talking about tubes and bipolar transistors. They are almost at opposite ends of the spectrum. The tube being high and the bipolar being low. Matching networks such as a "pi" network commonly used in tube technology has little use in the high power bipolar world because the values to make it work there are impractical.

If you're new, I'd suggest staying away from dual antennas. They are not a good idea for cars or small trucks - they look nice, but will actually decrease performance by their interaction with each other.
If you insist on dual antennas don't just simply get an adaptor. Get a phased harness - connector plus two co-ax's of equal length.
I'd reccomend something with a good connection to the metal vehicle body - trunk mount type or permanent mount (via a hole drilled in the body) or bumper mount - magnetic mount is least desirable for a permanent setup. Magnet mount should only be considered in the case of temporary installations because they are poorer performers.
Try Wilson or K40

Hello Nickle911:

I would suggest a 5/8 wavelength, ground plane antenna. Hy-Gain made the famous Penetrator 500, that worked great. Avanti made the Sigma 5/8, it was also a great antenna. But these antennas are no longer made, the companies out of business, or changer product lines.

I saw this Penetrator 500 on E-bay at:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=399600126

I sell a commercial version of the 5/8 WL antenna, The Mastodon 5000, adjusts to work in the range from 24.8 to 33 MHz, that has been structurally improved, and has a very low loss impedance matching device. That can take a lot of power. And has four 1/4 wavelength ground radials, that work with the impedance matching device to reduce interference to neighbors electronics. But this commercial grade antenna isn't for everyone, the price tag of 279.95, plus shipping.

I have spare parts, and assembly instructions for the Penetrator 500, and Sigma 5/8. And have a bolt on replacement, impedance matching device that has a bunch less loss than the stock impedance matching wires.

Jay in the Mojave

TSH,
Personally, I think you would be better off with a single antenna, but that's up to you. Need to pay particular attention to how they are mounted, and use a 'phasing' harness to hook them up.
The one thing I see where your going to have trouble is mounting the antenna(s) on your fibreglass 'cap'. Even with mechanical backing to prevent cracking, you haven't established an electrical ground for the antenna(s). No ground, no 'worky'.

I was hoping someone could help me with this since I know little about antennas. I would like to install an antenna on the front of my pickup somewhere around bumper or mid grill level. I would like to do this in order to fabricate a solid mount which seems non existent in the fender/hood gap variety. I was wondering if a no ground plane antenna such as the one made by firestik would perform as well as a regualr ground plane antenna or is it a tradeoff.
Thanks very much,
Andrew

a no ground antenna never performs as well as a grounded
system. use them only when you have no other choice.

Fair enough .... I guess what I was getting at was does the bottom of the antenna need to be level with something like the wide expanse of the hood or fender or does the fact that it is grounded to the vehicle in any place suffice?

there are several ways to get really good "swing". They are hard to explain without having the radio here to show you. If you want, there is a really easy way to kind of "cheat"...replace R238 with a 1meg resistor. Then set your dead key where you want. Now although that works, there is in my opinion a better mod. The best way is to take it to a tech

> how is impedance apparent it either is or it isn't..

Your comment right their PROVED to the learned of the group that you have
but a limited
knowlege of how a solid state amplifier works.

Apparent impedance is a load that LOOKS to be resistive, but is ACTUALLY a
combination of resistive and
reactive components.

For instance, you might see a 1 to 1 SWR with an antenna that has 60 ohms of
resistive impedance,
but also has 10 ohms of capacitive reactance.

The APPARENT impedance is 50 ohms... The real (complex) impedance is 60-10j

Radio Handbook by Bill Orr. Get it. Read it. Shut your hole until you do.

Not true, Peek.

A TRUE combiner has near no loss when in TOTAL balance, and when it is
working correctly.

Look at the pieces of shit that go in the Texas Star amps. That combiner on
the sweet sixteen wouldn't
hold up in a DaveMade 4 pill.

ROTFL!!! I am so sick of phones I turned my ringer off a long time ago. I only turn it one when I am expecting a call. These people carry it around with them! I guess I'm a hermit at heart and have lived isolated in the mountains too much. What I did was ask her to come over and make a call from my house while I was transmitting. She said she was wrong without apologizing. (shrug) I am relieved. Thank you all for your responses. I enjoy my CB and I don't want to bother my neighbors now that I have to live so close to them.

I have a 900 Mhz.. Panasonic and can use
any where in the house, over the radio
at the base of the tower and not a
whisper when the Galaxy is keyed in am
or SSB. I have a Shakespeare ABS 1600
antenna.

It would have to be 33.333 order
harmonic which would be impossible
because of the odd number, and the
signal harmonic that far down would me
nil even at 1000 watts at 27 Mhz.

That just leaves swamping probably with
a ground loop problem.

Daniel Friedrichs wrote:

My amp was actually an old DX 600 that #12 brought up to 667 design and beyond. some extensive/expensive work. A new one would have been a better deal.
I checked his notes that were sent back with the amp his test voltage was at 14 volts. With his radio he was seeing about 700 watts. My radio which has a much higher peak output pushed it to 800. Suggestion was to replace the finals some time in the future and I would probably see 900. Dennis put two 60 amp fuses. He noted only 40-50 would be required 60's is what he had at the time.
I will be happy to just get it installed in my mini-van.

It is a good mic but be careful of the settings. The amplifier amplifies everything including ambient noise so if you have a noisy truck drive with the windows down etc. a road king noise canceling mic may be better. The amplified mics can be touchy to adjust with echo boards and amps too.

Well the 99A put out by Soloarcon is good. Another is the I-Max 2000. But if you are willing to shell out money, go with a good beam antenna. Some cost just under $200.

Hi Phil,

Personally I still prefer the Starduster Base Antenna. Recently I
came across a few, new in the package, Starduster/Skylab antennas and
sold them all but one. If you are interested in it, e-mail me.

Dixieboy

OK... I'm going to try not to be too technical here...

With the typical CB radio, it is possible to squeeze a little more
power out of the transmitter by playing with capacitor values in
the tuned circuits and performing a careful alignment, but you'll
usually only get another few hundred milliwatts, or a Watt if you
are really lucky. This increase is insignificant. Even if you
doubled the power output, that's only a 3 dB increase, and that
amount of increase is not even distinguishable by the human ear
on the receiving end. What I'm saying is, don't waste your time
diddling with the radio. You will get no benefit from it.

Since the set is brand new in the box, I'd suggest you seize the
opportunity to make some money, and put it on eBay. There are CB
collectors who'd love to own a pristine original vintage set like
that one. Turn your five bucks into a whole lot more, then buy a
nice modern 40 channel set for your pickup. The performance of
today's receivers is much better than the early 1970s technology
in that Cortez, and with the channels being as crowded as they
are, and with all of the bleedover, you'll really appreciate a
better receiver. Not only that, but you might as well have all
40 channels at your disposal.

With that in mind, I would replace the coax inside with a length of RG8X
just like what is there on the outside. Then try it measuring again.

I have heard that connecting two different kinds of coax would give you a
mismatch because of the different capacitance characteristics of each type
of coax. Joining the same type would be better.

I prefer a good aluminum 5/8 wave antenna with a ground plane. Maco still makes one. That would be a good place to start out.

If you need a stronger signal, go with a 4 element beam. They re light weight, not much wind loading, small turning radius.

The 2 element quads like a pdl2 or a Superhawk would be a little smaller package but still have more gain than a vertical.

A hd tv rotor would be able to turn it. I have good luck with my channel master rotor with a thrust bearing. Alliance makes a good one also. Stay away from the cheepie ones sold at Menards or other chain stores. I had one (5 wire cable) and every time I transmitted it would turn the beam, and when I would unkey, it would go back to where it started.

Vertical antennas would be a good place to start and the Yagi or Quad would be for talking farther, having rear or side rejection, or being able to switch polarity.

A-99s are about as foolproof as a CB antenna gets.

Above the mount are the tuning rings. Look at those rings
(use binoculars if you have to). Where are the rings in
relation to the threaded portion that makes up the range
of adjustment? The rings should be locked together near
the middle of the adjustment range. If they have come apart
and/or are at either adjustment range extreme, you'll have
to find a way to get up there and put them back where they
belong. If they are together and in the middle, your problem
is likely to be coax or coax connector related.

I wouldn't use RG-58 for tying up newspapers. It sucks. Use RG-8M or 8X as
a minimum. Even for short runs, the 16 gauge center conducts better then 20
gauge centers. Try using 20 instead of 16 for your speakers. It chokes & sucks!

Andy in RI wrote:

I have a 959 and I love it! I can't believe you can buy this radio for under $180 with this many features on it, especially with the freq. counter and everything.
I haven't had any problems with mine at all. I sent it to Panther Electronics, who is an authorized Galaxy repair center to have what they call a "total makeover" done on the radio. In addition to the normal peak, tune and alignment, they beef up some parts in the radio to really make this radio scream.
My radio does 32 watts peak on a bird beter. The audio is super clean and super loud.
Being that Panther is an authorized Galaxy repair center, your 2 year warranty won't be voided by having the mods done.
If you have any questions, let me know.
If you want to find out more about Panther Electronics you can go to www.panther-electronics.com. If you decide to call them, ask for John Mahoney.
Take care

I just opened a NEW cobra 25 (first time out of the box)and
guess what? the damn 3 pin power plug was reversed . (the one
cobra supplied with the radio..... it had been made that way.
of course it blew the dioad. thats no problem. couldn't
believe they shipped it that way..... cost me a sale.

go figure.

There is nothing internally that is different except for the
receive circuit. Somehow or someway the reception almost seems
alot clearer with the LT's than the XL's. Otherwise, the
external and lighting features are alot nicer.

the only weak part I can think of would be the regulator...but
if you don't peak it over 12 watts dead key it will last.

Source record: 46887

then why does the davemades and xforce amps who use 3 turns on there 4 pills do more watts than pretty much whats else is on the market? this has been pretty much proven the past few years ... if you say most are using 4 turns or better.. less turns means narrower bandwidth ...
And if what you say is true then why does a 2 pill use 2 wraps that would be a 4:1 turns ratio correct... 4turns x 2 ohms as you said thats what the output impedance of a pair was in another post is hardly the 50 ohms you are looking for... Answer ..Why is this?...

... I can take and build 2- 2 pill stages at 2 wraps each and combine them with a 2 port combiner *- and tune it with a LC network at 27 mhz which has been tuned at exactly 50 ohms ... and have it do the same amount of watts that a 4 pill with 3 wraps will do... and you say that 3 wraps isnt right... i say build something that is proven better and prove to us that it works better than what is out there otherwise it is all hot air ... I forgot everyone out here makes the best amps we jsut dont get to see them...

Given that you are the only transmission on a given frequency, then yes, it should be heard a longer distance because the background noise would be minimal. You can normally hear a signal until its strength declines to the level of the noise.

Big deal, you damn sure don't impress me, if you design and build amplifiers
why are you so impressed with your one pill amp, why didn't you design the
board for that? the only part I seen in that thing that you might have hand
made was a couple of coils, for all I know that too is a trashy piece of
junk. you keep acting like you know so damn much, why don't you prove it
once in a while. Take a picture of something you designed and post it. the
one pill you posted is a cake walk compared to a FET amp using MRF157.

you may be better off with a wilson 1000 or 500 Mag mount because for the dual antennas to work the most effiecient, they have to be co-phased. In order to do this properly, you have to have 102" between the antennas. You dont have a 102" wide truck do you? But I am sure others will also suggest a wilson product. You could always go with one fiberglass antenna on your truck too. I use a Wilson1000, and have no rande problems whatsoever, I have talked 30 miles on a stock radio on a quiet night. Good Luck.

Chris

332. ?Broken Johnson Radio?

Date: 2000-08-04 00:00:00 UTC
From: Frizz <senorpurpl@hotmail.net>
Message-ID: <8meqgu$q80$1@bob.news.rcn.net>
Source record: 46756

I got a Messenger 223 base from a yard sale and powered it up. It was working (only putting out about 2 watts) but there were some loose connections inside to one of the speaker wires and a few other places. Here's the problem, I unplugged it to solder the speaker wire but when I plugged it back in, the underneath of one tube started to smoke. This tube is the one all the way at the back near the power cord. Underneath the tube is a resistor that connects to two pins and seems to be what is smoking. Can anyone tell me what this resistor is or if I should check a few other things on this radio before or after replacing it? There was also a disconnection of a capacitor from the fuse holder that I 'think' I reconnected correctly (to a piece of lead that was hanging out on the fuse holder that looked like it went to the disk capacitor). Can anyone help me with this thing or am I totally lost and should just chuck it? It is in beautiful condition and I would love to get it working so any help is appreciated. Thank You!!!

Source record: 46759

well frizz the tube is the rectifier and should be replaced with
a solid state one. the tube is a 12bw4. the resistor is a
4.7 ohm 1 watt. bout all it does is regulate the voltage to
the light bulbs...if it burns into all that will happen is the
lights will go out. it is R-68.
replace the filter caps. C-1 is a can on top and C-2 is the
brown tube by the line cord on the bottem. it should then work
like a new one. plus clean all the controls.

Have seen the 'Expo Kits' for years, but have never used one. Mostly interseted in the ones for the 148GTL and 21XLR. My cobra 148GTL works well, but it would be nice to hear whats going on below .815, and I can't find any mod.s on the Cobra 21XLR I was given, lost My PLL Data book when I moved and don't want to buy another at this point in time. thanks for your replys. TTYL 738 in Las Vegas....

p.s. anybody here in Vegas, just moved out here, and don't hear any local people.

>sucks!
>

And what tests have you done on these? How do they compare on a short run that this guy is talking about with low power? I use RG-58 for my VHF antennas because the radio the antennas are hooked up to only puts out about 12 watts, and the coax is only 50 feet long. For my HF rig, at 350 watts, I use RG-8...

I'd be interested to see the results of the tests that you ran to show the difference between the types of coax.

A non-scientific test. I replaced the RG-58 in my car with RG-8M. Big difference in receive and a noticeable difference to the folks I talk to. I was told it was clearer, louder and stronger. One guy thought I bought an amp. FWIW, this was 5 years ago, and I never changed back to '58 coax.

Hello All: Need advice, help, suggestions, criticisms whatever!

I have a Texas Star 500, that about every 2 to 3 months blows up the keying transistor, a 2N2222A, ...WTFO?

The input RF is coupled to the transistor thru a 15 pF disc capacitor. And the bias resistors for the transistor check out all right. Haven't checked the reverse voltage/current suppresser diode across the relay coil yet. I bought a one lB bag of the 2N2222A transistors at the TRW swap meet, but I am ah geetin low on em.

I am driving the amp with a Emperor 5010, that puts out 25 SSB and 3 watts AM dead carrier.

Jay in the Great Mojave Desert, ...just down the road ah ways from the fillin station.

toolfree you better hit the books your comprehensions skills are lacking ..here are a few definitions of impedance for you ... as you will see the word 'apparent' is never used ... because impedance is a combination of them, what difference would it make if the load "looks resisitve" it either is impedance or it is not .. "> Apparent impedance is a load that LOOKS to be resistive"

try these when you put down that out dated Bill Orr book...
Secrets of RF Circuit Design 2nd edition..... Joesph Carr
Practical RF Handbook 2nd edition ...Ian Hickman...

The term complex means that the numerical resistance and reactance values can't be combined arithmetically because the voltage and current are not in phase.

Impedance is a vector (two-dimensional)quantity consisting of two independent scalar (one-dimensional) phenomena: resistance and reactance.

impedance: The total passive opposition offered to the flow of electric current. Note 1: Impedance is determined by the particular combination of resistance, inductive reactance, and capacitive reactance in a given circuit. (188) Note 2: Impedance is a function of frequency, except in the case of purely resistive networks.

Impedance: when a circuit contains both resistance and reactance the combined effect of the two is called impedance. Impedance is thus a more general term then either resistance or reactance and is frequently used even for circuits that have only resistance or reactance
although usually with a qualification .. such as "resistive impedance" to indicate the circuit has only resistance...

electrical impedance

measure of the total opposition that a circuit or a part of a circuit presents to electric current. Impedance includes both resistance and reactance. The resistance component arises from collisions of the current-carrying charged particles with the internal structure of the conductor. The reactance component is an additional opposition to the movement of electric charge that arises from the changing magnetic and electric fields in circuits carrying alternating current. Impedance reduces to resistance in circuits carrying steady direct current.

The magnitude of the impedance Z of a circuit is equal to the maximum value of the potential difference, or voltage, V (volts) across the circuit, divided by the maximum value of the current I (amperes) through the circuit, or simply Z = V/I. The unit of impedance, like that of resistance, is the ohm. Depending on the nature of the reactance component of the impedance

(whether predominantly inductive or capacitive), the alternating current
either lags or leads the voltage. The reciprocal of the impedance, 1/Z, is
called the admittance and is expressed in terms of the unit of conductance,
the mho unit (ohm spelled backward).

Man I never seen a 2N2222 in any I ever fixed.

THe 350.500.667 all use a 2N2907. Thats a PNP device.
The 470 ohm resistor supplies a positive bias to
turn the thing off. The negative portion of the RF sample
keys the rig. I quit using the 2N3906. It won't hold up.
2N2907A

You got a strange one there fellow. Who knows?
Try using 2 devices in parallel. That
works for me.

I am almost impressed....

Wait.. No, I am not.

The "Outdated Bill Orr" book you refer to is one of the longest standing, constantly updated, still in print works of art on the RF subject one can find.

Billy Orr... An Eimac Engineer.

With input by Helge Granberg.

Two of the most acclaimed people in the RF industry.

I suppose you will also take the stand that parasitics DON'T happen in a amplifier, and gold sputtering in the tube DOESN'T happen because of a parasitic oscillation, right?

"The Game" <TheGame@yahoo.com> wrote in message news:7VEi5.717$uU1.22682@news3.voicenet.com...
> toolfree you better hit the books your comprehensions skills are lacking

No, I don't think they are. Yours, however, seem to be non-existant.

> ..here are a few definitions of impedance for you ... as you will see the
> word 'apparent' is never used ...

Because they are not dealing with the complex impedances found in RF work, they are talking
about simple resistive impedances for the most part.

because impedance is a combination of
> them,

A combination of what? This isn't even a complete sentence, and you say I have a problem with
reading comprehension?

what difference would it make if the load "looks resisitve" it either
> is impedance or it is not ..

No, a load looks resistive, reactive, or a combination of the two.

A load that is COMPLEX (meaning it has both resistive and reactive components) can also APPEAR
to be truly resistive at a particular frequency. That is where the error of an SWR meter comes into play.
It can't differentiate between complex impedance (apparent) or purely resistive (I think this is what you think

"impedance" is)

"> Apparent impedance is a load that LOOKS to
> be resistive"
>
> try these when you put down that out dated Bill Orr book...

Outdated? Updated every year, with some of the top minds in the world on
its editorial staff, regarded
by almost ALL RF industry personell as a MUST READ, and a MUST HAVE on the
bookshelf.

> Secrets of RF Circuit Design 2nd edition..... Joesph Carr
> Practical RF Handbook 2nd edition ...Ian Hickman...

And your point is?

>
>
> The term complex means that the numerical resistance and reactance values
> can't be combined arithmetically because the voltage and current are not
in
> phase.

And the voltage and current aren't in phase why? Beacuse their is reactance
on the line.
With reactance on the line, how can YOU call the load purely resistive?

Your quotes are disproving your entire point, and your too stupid or
pigheaded to see that.

>
> Impedance is a vector (two-dimensional)quantity consisting of two
> independent scalar (one-dimensional) phenomena: resistance and reactance.

Duhh.

Show me reactance on an ohm-meter?

>
>
> impedance: The total passive opposition offered to the flow of electric
> current. Note 1: Impedance is determined by the particular combination of
> resistance, inductive reactance, and capacitive reactance in a given

OK, so you proved that you can copy from a book.

>
>
>
>
> Impedance: when a circuit contains both resistance and reactance the

> combined effect of the two is called impedance.

So you REALLY think that when I have a pure 50 ohm carborundum resistor, it doesn't have
a true 50 ohm impedance?

Impedance can be 50+j0

Impedance is thus a more
> general term then either resistance or reactance and is frequently used even
> for circuits that have only resistance or reactance
> although usually with a qualification .. such as "resistive impedance"

Sounds an awful lot like the term "Apparent Impedance" just might mean that it isn't a
PURELY RESISTIVE LOAD, huh?

That is those reading comprehension skills coming out again. Sorry to have actually beaten you
with brainpower. Your posts are proving this is an unfair fight... Me being able to actually convey
MY OWN thoughts and stuff.

to
> indicate the circuit has only resistance...
>
> electrical impedance
>
> measure of the total opposition that a circuit or a part of a circuit

Blah, blah, blah. This has nothing to do with what we are talking about.
Nice try, though.

>
> The magnitude of the impedance Z of a circuit is equal to the maximum value

> either lags or leads the voltage. The reciprocal of the impedance, 1/Z, is
> called the admittance and is expressed in terms of the unit of

conductance,
> the mho unit (ohm spelled backward).

So what have you accomplished?

Typed a bunch of stuff (Mavis Beacon ain't got nothin' on you, boy!).
Didn't comprehend
it.

Your posts say nothing about what happens when you use a simple bridge,
containing pure resistance on one
side of it, and compare a complex impedance on the other.

I still stand by my comment.

Take a SWR meter apart.

Remove the 50 ohm resistor.

Replace it with a 100 ohm resistor of the same wattage value.

Now, connect a 200 ohm resistor up to one side, in parallel with a cap
having -j100 ohms of reactance.

What happens??

VOILA! The SWR meter believes you have a PURELY RESISTIVE 100 OHM LOAD!!!

That would be apparent impedance, you dolt.

However, use a vector analyzer, or a AC Circuit analyzer (MFJ antennalyzer
is good), and you
will see 200-j100 ohms of impedance!

/end skewl

Jeeze... Some people are too scary to breed.

TollHOlio

Not totally true Brian.

Single ended tube amplifiers, of the ceramic class often have transformation ratios of 100 to 1 or greater (5000 ohms of plate resistance).

A solid state amplifier is only at 50 to 1 (assuming a 1 ohm collector impedance).

Pi networks will work, but only in the single ended world.

What you really have to look at is the Q of the circuit.

Also, people don't want to "tune and load" their solid state equipment, and so many of the people using solid state (and tubed, for that matter) haven't a fucking clue one as to how to properly tune it, so their would be MANY blown transistors as the collector RF voltage soared WAY above the SOAR of the device in use.

Your an idiot.

This is the last time I take you to school.

"The Game" <TheGame@yahoo.com> wrote in message
news:39li5.657$uU1.18356@news3.voicenet.com...
> then why does the davemades and xforce amps who use 3 turns on there 4
pills

Because they use the improper ferrite to begin with in their transformers.

> do more watts than pretty much whats else is on the market? this has been
> pretty much proven the past few years ...

Not really. They sure do LOOK a lot better than the others, though. I can
clip a resistor in a
Texas Star 250 and see app. 500 to 1kW of output on the Bird.

Wattmeters are bullshit for anything other than a reference point, and a
lousy one at that.

if you say most are using 4 turns
> or better.. less turns means narrower bandwidth ...

The amount of turns has NOTHING to do with the bandwith, unless you are
using the improper
mix of ferrite for the band(s) being designed for.

Dave and X-Force (and the other battle box builders) use ferrite designed
for a completely different
frequency range. Therefore, they have to forgo the "correct" LC ratio, and
turns ratio. They make up
for that "incorrectness" by LC circuits elsewhere, or in the combiners.

> And if what you say is true then why does a 2 pill use 2 wraps that would
be
> a 4:1 turns ratio correct... 4turns x 2 ohms as you said thats what the
> output impedance of a pair was in another post is hardly the 50 ohms you
> are looking for... Answer ..Why is this?...

Zcollector=(Vcc(Vcc))/(2Pout)

Therefore, you see different impedances for different levels of drive,
output, and voltage.

And each transistor is different because of the difference in collector
reactance present.

>
> ... I can take and build 2- 2 pill stages at 2 wraps each and combine
them

has
> been tuned at exactly 50 ohms ... and have it do the same amount of watts
> that a 4 pill with 3 wraps will do... and you say that 3 wraps isnt
> right... i say build something that is proven better and prove to us

We?? You got a mouse in your pocket?

I got out of transistors long ago. Once something is mastered, the master
moves on, and goes to play with tubes.

Peek, how many turns you using on that 750 Bird watt 2 pill you got?

And what transistors you runnin?

> that it works better than what is out there otherwise it is all hot air
...

Cookie boxes seem to eat DaveMade around here.

Guess we HAVE found something better.

> I forgot everyone out here makes the best amps we jsut dont get to see
> them...

Nope, you don't.

Some of us build for people that actually USE the head God gave them, those
that shut their Fing mouths and
listen when someone smarter then they speak.

You should learn that lesson, Einstein.

Put 2 diodes in series from base to ground.

This clamps the input voltage to keep it from going over 1.2 volts and
blowing the transistors.

Get a reflected power meter (shitty wattmeter works good, hooked up reverse)
to see if you have an impedance input problem.

Could be the rectified voltage is getting too high for the BE junction of
the transistor.

Okay, I have never had, until now, a CB radio. I recently received a CB from a friend and I wish to use it in my pickup. I can get the radio itself hooked up fine. My question is the antenna. I want to side mount dual antennas to my fiberglass cap. I plan on reinforcing the back side of the cap/antenna mount so the flexing doesn't crack the cap. My real questions are:
1. are dual 4 foot fiberglass antennas adequate?
2. do you recommend something else?
3. how far past the top of the cap should the antennas extend? does it matter?
4. How do I run the dual wires into the single input on the back of the radio? I assume there is an adapter.
5. What else do I need to be aware of.

Thanks much for the help

reminds me of first grade nenner my brother can beat up your brother .WHO CARES .It takes a good radio (not over modulated) and a well thought out ant system.to radio.The only thing excessive wattage is good for is dead keying over someone who really cares about the radio hobby.Its not about power its about communication.As far as transistor amps go the majority of them are nothing but splatter boxes no good for radioing.Well this is one mans opinion take it or leave it.I think there are more that feel the same way.

It is highly unlikely that you're interfering with cellular service. Sell phones operate at about 850 MHz, CBs at about 27 MHz. That means that in order for you to actually be causing interference, you'd be interfering with a frequency that is almost halfway between your 30th and 31st harmonics! This would be highly unlikely particularly if you're not running power and your antenna is properly installed...

You need to mount those antennas to the metal body\chassis of the truck or the mag mount Wilson on the cab roof. Try www.firestick.com for some mounting suggestions and hardware. There are better antennas than the Firesticks but they have a nice selection of mounts. The advice to stay away from duals should be taken seriously you have nothing to gain. Put the money into as good a single as you can.

None of you guys understood his original question. In a nutshell, he means that given existing traffic he can talk to someone, say, 5 miles away. He wanted to know, given a perfect world with nobody on frequency except himself and his friend, would he be able to talk a longer distance. The answer is yes, because the ambient noise would be abscent and the signal could be heard a greater distance until its relative strength equalled the noise/static on the frequency.

I don't have any modifications on the radio. This problem is happening on a stock 148f GTL.

<< Simple problem.

Whoever did your clarifier modification did it WRONG.

The MB3756 control voltage generator is getting shorted out.

Put a 250 ohm resistor in line with the lead going from the clarifier potentiometer to the MB3756 IC.

The symptoms you are seeing are the results of a hack doing the modifications.

Toll Free

Be aware that when the car body is the ground plane, that the car body becomes part of the antenna system. Where you place it may make it directional. If your antenna is on the rear of the car, it will have more range to the front. If the antenna is on the front of the car it will be more directional to the rear. If it is on the left, your greatest range will be to the right, if it is on the right you will be directional to your left.

Also be aware that the higher it is mounted, the greater will be its range.

But to answer your question: If your ground connection is adequate, it is adequate

That was my point, you said in total balance, in total balance an 1/8 watt resistor would do fine in a 32 pill. I know as well as you do that total balance is a rarity for most common amplifiers. The coax used in the splitter/transformer combo professor is referring to will melt in an imbalance, the commercial splitters like he is referring that I have seen only used a teflon tape outside. the insulator between the coax and shield were plastic, believe me, the splitter he mentioned is an easy way to "tie" to 50ohm outputs together, but I will still argue that it is not the only way to do it correctly.
On the Texas Stars you are right, one of a few of their flaws. I know that their configuration and their bias scheme works well and has over the years showed to hold its own, reliably!

396. Newbie... Looking for good tutorial

Newsgroup: rec.radio.cb
Date: 2000-08-04 00:00:00 UTC
From: TheNoid OR <noid@involved.com>

Hey Peeps.. I'm looking for a good online tutorial and explanation of a lot of the CB terms.. and how they work.. MAINLY SWR.. I want to know WHAT it is (Other than Standing Wave Ratio).. and how I can get rid of it/tune it... what the best levels are.. and what causes it. I wouldn't mind learning about Amps too..

Also.. has anyone had any experience with building linears from schematics? Any good schematics to offer? I have a couple 2 "pill" schematics that look promising. I wouldn't mind giving them a try. I am fairly electronically "gifted?". I guess. Anyways.. Let me know... thanks in advance!

Lloyd, I have a serious question for you. If you're really a prophet of God, why advertise it in your username? A true man of God can stand on his own, and people will recognize it and flock to him. It is only the false ones who have to push themselves on people one way or another.

Jesus did nothing to advertise his "status." His mere Presence was enough... people KNEW they were in the presence of Holiness just by his Presence. Why do you feel you have to jump up and down and scream about who you believe you are?

Why don't you give that a little thought, tone down your posts, post under the name "Lloyd" instead of "Prophet Lloyd Davies," and rejoin the human race? People might even like you if they knew what you were really like underneath all that huffing and puffing, who knows?

Anyway, if I ever met you at a hamfest, I would be happy to have a cup of coffee with you.

Take Care,

W.

Look past the ego, and you will see,
what dwells within is God, not "me."

You would do better with an antennae that`s grounded, either physically or magnetically. A single mag-mount K40 or Wilson on top your cab is all you need. An "extra" antennae does little if anything.

I haven`t got all the details, at the present time, of this 2 tuber.
I think that the price I was quoted was a little steep for this used unit.
I would like to know what you think this amp would be worth, in excellent
condition inside and out.

Any thoughts as to what output you would expect from this amp (rms or pep??)

Thanx
Randy

well, let's see, driven right, maybe 4000 to 6000 pep ought to be about right for output. well this box has two 1200 tubes , two sockets, two chimneys, blower for tubes, one peter dahl transformer, possibly one peter dahl filament transformer, capacitor bank or oil filled cap, vacuum variable capacitor for plate tuning, that's about it for expensive parts. just figure out what each one of these parts would cost you on the open market and add in a little labor and see where it gets you. then compare this to the price. how much does he want for it?,.....cd is out.....

Source record: 46898

I'm sure there are many online tutorials, just go to yahoo or some other web site with a search engine and type in SWR, or amplifier, or whatever you are looking for.

I like to think of SWR like I think of throwing a rock into a lake. The physics are a lot alike. If you throw a rock into a perfectly still lake, then ripples of water will travel away from the point where the rock hit the water. This is much like the radio waves behave. If the ripples hit a rock cliff, then the waves will bounce off the cliff and you will see some waves heading toward the cliff, and some waves being reflected from the cliff. This happens because the rock is much more dense than the water. But if there is no cliff, then the waves will continue to travel until they become weak enough to be undetectable. In radio terms, the different densities of water and rock would be called impedance. So if you had a transmitter (a pebble) and started transmitting (dropped the pebble into the water) and the waves (water waves or radio waves) encountered something in the path of a different impedance (density), then there would be reflections in the opposite direction (again, water or radio waves, they act alike). If those water waves encountered an area where the density was slightly different, let's say an area where there was lots of algae or muck, the waves might still travel thru it, but wouldn't be a strong. An antenna which is not tuned correctly to match the impedence of the radio and coax will not stop your radio waves, but much of the radio power that would usually go out the antenna, would be reflected back to the radio. An antenna which was perfectly tuned with the radio (all impedances equal) would result in most of your radio waves being radiated. If the antenna impedance is different from the impedance of the radio and/or coax, than you would get some of your power reflected back to the radio, instead of being radiated. The more that the impedances are different, the higher your SWR will be. A perfect SWR is 1:1. But an SWR of 2:1 or higher means that your antenna impedance doesn't match your radio/coax impedance and should be adjusted.

Hope this helps, gotta run to work!

Robert

408. Tubes?

Newsgroup: rec.radio.cb
Date: 2000-08-04 00:00:00 UTC
From: sideband <sideband@cac.net>
Message-ID: <398B5BEE.33381A2C@cac.net>
Source record: 46899

My stepfather recently passed an old tube linear down to me. It's a home unit, runs on house power, and while testing it, it seems to not be doing what it's supposed to. He said that he'd gotten 500+ watts out of it. It's a two tube unit. The tubes look to be in pretty sad shape... Large black spots on the insides of the glass.. The only markings are as follows:

6LQ6

6JE6C

MAGNAVOX
337 JAPAN

I don't know much about Tube amps... But this one's only putting out around 50watts avg, 125 PEP... I've checked solder joints, etc, fixed a few, and, while all the rest of the components seem to test out fine, I can't seem to get any more than 125-130 watts out of it.

Was my stepfather mistaken about the amp's capabilities, or is there something else wrong with it? The amp is red and white, with a range switch for 10, 15, 20, and 40 meters, a load and tune knob, a BIL switch (receive amp?), on/off, standby/oper, and RF Swinger switch.

So could some of you amp guru's/HAM operators help me out with this one? I want to get it into good shape before I decide what to do with it.

If it helps, any, I'm studying for my HAM ticket... I just can't seem to find the time to go test lately.

If it needs tubes, then where can I find a matched pair (if there is such a thing for tubes) to put in here?

Thanks in advance.

Robert:

I was quite impressed with this way to explain SWR. Now please don't take this as a flame; it's not. One fine point that needs clarification: you're not tuning the antenna to the radio... you're tuning it to the vehicle the antenna's on...

If you don't believe me, take a radio, antenna, and coax, put it on/in a vehicle, and tune for best SWR. Now take the same radio, antenna, and coax, and put it on/in a different vehicle..

If the antenna is being tuned to the radio and coax, the SWR wouldn't change, right?

Well, it DOES change... If you don't believe it, try that little experiment and find out for yourself.

It's a ratio of transmitting element to ground plane that, at its base, causes that reflection back to the radio, and in effect, is what causes SWR. A mismatch between the antenna length and the "length" of the ground plane causes more reflection than a closer match.

Now certain antennas, Dipoles for example, hold their own ground plane. The Wilson "No-Ground" is a good example of this. They'll tune no matter which vehicle they're on. I've had dipoles change SWR from vehicle to vehicle, and there's alot of technical stuff that explains that, but I won't go into that here... The good news is that the dipole didn't change nearly as much as other antennas have for me...

Good way to explain SWR, tho.... The rest of the story was excellent.

My bet would be to replace the diode across the relay, could be going bad and spiking the transistor. I see the same thing happening on cor circuits in repeaters.

You might try a smaller coupling cap on the input and do the doubble diode trick to limit the Peak to Peak input to +-.7 volts if it keeps blowing them.

One - almost brand new President Grant rig with around 80 channels above 40 and 40 below. 10 turn clarifier and tuned up. All work done by a professional !!!
This is one nice AM, LSB, USB rig with original mike, mounting bracket, and power cord.
Looks a 9.5 out of 10.

$125 (shipping included to USA) for a quick sale to someone who can pay with Paypal within 24 hours.

I will not accept any other payment method. I will ship the day after payment is sent. If you tell me to hold it you have 24 hours to pay and then I sell to the next person. Sorry to be like this but...
I listed this a few weeks ago at $130 without shipping and got several takers, none of which have sent any money yet, that is why I am going paypal only.

This is a heck of a deal on this rig. Rig was $185 new and $75 worth of mods done to it. Used for only about a month. This rig has never been in a vehicle, base use only, non-smoking environment. Need to sell quick.
Please check my feedback of 278+ on ebay to be sure I am honest. I would list it there but can't mention the extra channels. Rig 100% guaranteed to transmit and receive perfect.
Thanks,
Mark

Good analogy. Question:

What's the velocity factor of a lake? What losses are
suffered per 100 feet of lake?

I have seen antennas mounted on grill guards, but haven't experienced doing it myself.

I have found that when I mount an antenna below the roof line, and close proximity to metal (like on a pickup box behind the cab) I have lots of reflected power (poor swr). I notice it more on shorter antennas. I mounted a 102" whip in the center of the box and didn't see much reflect.

Like James said, mounting it on the front will cause you to radiate most to the rear of the vehicle. I also see that antenna length seems to be cut different than the cutting chart shows when they are mounted on the edge of the ground plane compared to the middle.

Sorry to hear about your stepfather...

Black spots on the tubes don't necessarily mean the tubes are shot! I have seen this metal deposition on brand new tubes.
Take the tubes to a qualified tech and have them checked for proper emission.

There may be only one, but does this god prefer
a 1/2 wavelength dipole or a 1/4 wavelength vertical?

I could also ask if IT prefers USB or LSB, but I'm sure that
typical christian sentiment would always prefer the USB.

If God created all things, he created radio waves. Does that
make the FCC a religion or a demonic agency???

When SWL'ing, am I,...
A. "Rendering unto Caesar that which is Caesar's"?
B. Meditating on His/Her Divine Gift of EMR?
C. Being decieved by a demon into corrupting His gift?

Although I have no experience with your vehicle, I have with many
others. Some vehicles, like newer vans, are very easy to remove the
headliner and do the installation. On some older cars you can remove the
dome light and install the mount that way. Use a fish to pull the
coaxial cable to a convenient pillar. Standard hole sizes are 3/8" and
3/4". I would not install a roof mount antenna that calls for a bigger
hole than 3/4". I prefer to drill the hole from the inside out, but
sometimes you have to go the other way. If you install a Motorola style
NMO mount you have all sorts of options. A properly installed mount will
not leak, rust or crack. If you need to sell the vehicle you can install
a rain cap, a hole plug or just screw on a cheap cellular antenna.

Cbnewbie wrote:

>From: hshk@ix.netcom.com (HSHK)
>
>Just because they are not licensed or allowed
>to be on that frequency does not negate the
>fact that you are in violation of Part 97 by producing
>malicious interference by intentionally jamming.
>
>I agree with you wanting to jam them and all
>that, they drive me nuts as well, but by actually
>doing so, you are in violation of the letter of the law
>and worst yet, the spirit of the law.

Bill and all,

Here's my interpretation: The CB'ers on ten are unlicensed interlopers, while we are licensed to use any frequency between 28.0 and 29.7. Under Part 97, the CB'ers DON'T EXIST. How could we be in violation of the rules for deliberately interfering with a station that does not exist? What would the FCC list on the citation as the station being interfered with? How could this possibly be in violation of the letter of the law?

As for the spirit of the law, do these bootleggers, with their threats of physical violence and constant use of profanity, deserve any courtesy or consideration whatsoever by anyone licensed to use this band?

Someone mentioned earlier on this subject that we shouldn't stoop to their level and tactics. That reminded me of part of the reason we won our independence. The British were used to fighting using the clean, by-the-book, "gentlemen's" battle tactics of that day, which included standing erect, in strainght line formation, fully vulnerable, wearing their highly visible red uniforms, each soldier having orders to stand fast and aim their muskets and fire until he was felled by enemy fire. The Americans (the rebels) fought dirty. We had a rag-tag army and used ambush and guerilla warfare tactics. The British would not "stoop to our level" and lost a lot of good men, and with the help of France, we won the war.

I'm sure the FCC will do what they can, but there are literally thousands of interlopers and the FCC must handle them on a case by case basis. They will prosecute a few high profile cases from time to time like the one in Frorida, but in the meantime, the rest of us are being subjected daily to whatever abuse this scum wishes to dish out, over the very limited period of time when the sunspot cycle will allow use of this band at its best. Certain popular frequencies sound just like a congested CB channel when there is good sproadic-E. Sometimes the entire CW portion of 10 is

unuseable because of this profane trash. I have heard mentioned over the air that there is someone who calls himself "Old Man Copper", who has his own website and modifies and sells radios for the ham band at truck stops and encourages CB'ers to operate on 10 m. because the hams "don't use it."

That's why I am encouraging everyone to get in there and tie up all their "channels" with ham signals running perfectly legal modulation, keying, and vfo stability tests (and of course two-way QSO's whenever possible). The shrill sound of CW about 1000 hz off their carrier frequency drives them nuts. Their souped-up CB rigs don't have DSP and all the other high tech QRM dodging gadgets that the newer ham transceivers have.

I'm not even sure "CB'ers" is the best term to use for these outlaws. 99% seem to be truckers who use the radios to communicate about work activities. They are more akin to the New York City taxi drivers a few years ago who were using the 2 metre ham band as a cheap subsitute for commercial two-way business band radios. The attitude of the 10m. bootleggers is "I bought this radio and I am going to use it on whatever frequency I want, and to hell with you."

Could you imagine the outrage that would echo throughout the ham radio community as well as the commercial and broadcast industries (they are having their own problems with "bootleggers" in their spectrum), over the precedent that would be set, if a licensed ham were actually cited by the FCC for "malicious" interference to one of these "stations"? I would certainly demand to my congressmen to begin an inquiry why my tax money was being spent in such a fashion.

As for "asking the FCC for an opinion", that is very dangerous ground. The response would be one or two individuals' opinion and interpretaiton, not a consensus of the full commission, and if the response came back not to our liking on what was "legal", at best the person making the inquiry would be under a restrictive order, and at worse, the entire ham community would face additional government restrictions. Tha ARRL has long urged amateurs NOT to directly contact the FCC to ask for their interpretation of a rule, but to contact the League's legal representatives, for this very reason. (That was not a pitch for or against the League.)

See you all on 28.085!

73,
Don K4KYV

The Wilson should not require any additional bracing. If there is a stiffener in the roof you can bolt through that would be the best.. Make sure you can route your coax the way want before you drill the hole. After you drill the hole touch up the bare metal with some primer put a small bead of silicone around the hole to seal the mount. Grind or sand the primer where the sawtooth washer mounts on the inside or turn it back and forth to make sure it is making a good metal contact. Keep your coax routing as far from fan motors etc. You should be good to go.

Hello all, I am selling all of my radio and test equipment. Here is
the list:

1. One RCI 2970 10-12 Meter radio; 50W AM/FM/CW 100W SSB $225
With EC 2018 Road Noise Turbo microphone Included with radio
2. One Texas Star 1200 amplifier AM and
SSB $275
3. One Workman 2K Low Pass
filter SOLD
4. One 24VDC 1.5F
capacitor
SOLD
5. Two Radio Shack external
speakers $5 ea
6. One Super Penetrator mobile
antenna $20
With One 6" spring included with antenna
7. One 3 pad magnetic mount with 14' of RG8U 95%
shielded $20
8. One DAIWA Cross-Needle power/SWR meter 2KW max range $100
9. One Radio Shack 3A power
supply $25
10. One Radio Shack Frequency
counter SOLD
11. One 300 W MFJ 260C dummy
load SOLD
12. One 1.5KW MFJ 264 dummy
load $40
13. One 60A DAIWA power
supply $150
14. Assorted electronic parts in storage drawer
cabinet SOLD

All equipment is like new, REALLY. I take care of my equipment. The
radio and the amp are 6 months old.

John

P.S. I also have a 100MHz O'scope that sometimes works and sometimes
doesn't. It looks like a power supply problem that I was too lazy to
fix and now it doesn't really matter. It is a Textronix with all
manuals. Make me an offer if interested but it will probably cost more
to ship than you may be willing to pay.

I would highly recommend Jim Norton of Anniston, AL. He has been doing radio service since he was 15. He is a grandfather now, so he has seen it all.
People send their radios to him from all over the country.
He has his 1st class FCC license and he is a certified electronic technician on top of being a honest christian person.
If he can't fix it, it can't be fixed.
256-848-9949. Give him a call.
Take care

431. Illegal CB Transceiver List

Newsgroup: rec.radio.cb
Date: 2000-08-05 00:00:00 UTC

Illegal CB Transceiver List

The FCC's Office of Engineer and Technology (OET) has evaluated the devices listed below and has concluded that these devices are not only amateur transceivers but can easily be altered for use as Citizens Band (CB) transceivers as well.

As such, OET has further concluded that these devices cannot legally be imported OR MARKETED within the United States for the reasons discussed below.

Further, the FCC General Counsel has issued a decision in a specific case involving one manufacturer and has concluded that dual use CB and amateur radios of the kind at issue may not be approved under the Commission's rules and are in violation of several rules including the RF power level limits of 47 CFR 95.639. (letter from Christopher J. Wright, FCC-OGC to John F. Atwood, US Customs Service, dated May 17, 1999).

Transceivers used in the Amateur Radio Service below 30 MHz do not require FCC authorization prior to being imported into or marketed within the United States, but transceivers for other services, including the CB Radio Service (CB), do require Commission approval.

The transceivers listed herein and other similar models operate in the amateur "10-meter band" and are often referred to as "10-meter" radios or "export" radios. The amateur 10-meter band uses frequencies that are very close to the channels set aside for use in the CB service. Some of the transceivers that manufacturers call "10-meter" radios either operate on CB frequencies as manufactured and imported or are designed such that internal circuits can readily be activated by a user, a service technician or a dealer to operate on CB frequencies. According to Section 95.603(c) of the Commission's rules, a CB transmitter is a transmitter that operates or is intended to operate at a station authorized for the CB service. 47C.F.R. ï¿½ 95.603(c). The Commission's equipment authorization experts in the FCC Laboratory have determined that the transceivers listed herein and other similar models at issue here are intended for use on the CB frequencies as well as those in the amateur service because they have built-in capability to operate on CB frequencies. This capability can be readily activated by moving or removing a jumper plug, cutting or splicing a wire, plugging in a connector, or other simple means. Thus, all the transceivers listed herein and similar models fall within the definition of a CB transmitter. See 47C.F.R. ï¿½ 95.603(c). A CB transmitter must be certificated by the FCC prior to marketing or importation. 47 C.F.R. ï¿½ï¿½ 95.603(c); 2.803. Moreover, the dual use CB and amateur radios of the kind at issue here may not be certified under the Commission's rules. Section 95.655(a) states: ". . .([CB] Transmitters with frequency capability for the Amateur Radio Services . . . will not be certificated.)" See also Amendment of Part 95, Subpart E, Technical Regulations in the Personal Radio Services Rules, FCC 88-256, 1888 WL

488084 (August 17, 1988). This clarification was added to explicitly foreclose the possibility of certification of dual use CB and amateur radios, see id, and thereby deter use by CB operators of frequencies allocated for amateur radio use.

In addition, the Commission's equipment authorization experts have determined that the devices violate or appear to violate a number of the rules governing CB devices.

For example, they may use emission types not permitted, or emit RF power at a level in excess of the levels permitted in the CB radio service. See 47 C.F.R. ï¿½ 95.639.

In view of the foregoing, the following "10-meter" transceivers are not acceptable for importation or MARKETING into/within the United States. Importation AND MARKETING of these units is ILLEGAL pursuant to Section 302(b) of the Communications Act and Section 2.803 of the rules. Willful violations of the Rules and the Act may subject the violator to a monetary forfeiture of not more than $11,000 for each violation or each day of a continuing violation.

The Commission continues to review this type of equipment, and additional makes and models may be added to this list in the future.

LIST OF TRANSCEIVERS ILLEGAL TO IMPORT --- OR MARKET

GALAXY - models: DX33HML, DX 44V, DX55V, DX66V, DX 73V, DX 77HML, DX 88HL, DX99V and Saturn Turbo
CONNEX - models: 3300, 3300HP-ZX, 3300 PLUS and CX-3800
MIRAGE - models: 44, Galaxy 88, 9900 and 2950EX
NORTH STAR - models: NS-3000 and NS-9000
PRESIDENT - models: Grant, J.F.K., Jackson and Lincoln
PRO STAR - model: 240
RANGER - models: AR-3500 and RCI-2950
TEK - model: HR-3950
UNIDEN - models: HR-2510 and HR-2600
SUPER STAR - model: 121

For further information concerning the listed transceivers or similar models, contact Ray LaForge, or Gary Hendrickson at the FCC Laboratory, 7435 Oakland Mills Road, Columbia, MD 21046, (301) 362-3041 and 30433 respectively or E-mail: rlaforge@fcc.gov and ghendric@fcc.gov

What good is this list? Everyone knows that these radios listed can only infringe upon the 10 meter area. Heck if you really want to infringe then buy a Icom 706 or alike. Then you can infringe just about anywhere you want to.

While we are at it.......... If you really want to talk, buy a legit amateur radio. Get rid of any CB type radio. At this point you can are no longer be considered a CB'er. Because of the shedding of any evidence of a CB radio you no longer have to abide by Part 95 rules. This means the FCC can NOT inspect your set cart blanche. They must have direct knowledge of a transmission coming from your premiss. Additionally since you do not have an amateur license you are anonymous and have no reason to abide by part 97 rules either. Happy freebanding.

P.S. I can troll too.

```
Titan 201 handheld (otherwise known as the Eagle Spitfire). Unit has been
channel modded; mod procedure is included so you know what's been
done. Came from factory underpowered: 3-4 watts AM, 4-5 watts SSB
(peak) off batteries. Probably more on external power; never tried
though. As a result, didn't have much use for it, but couldn't
return it either. Condition-wise, it's a 9/10. Asking $80 + 6 (shipping).

Then tell the seller... I thought it was a decent deal.... for those wanting to buy Pyramids.. I'll stick to my homemade and my Astron myself... but hey.. what the hell.. just pointing out something to those that dont wish to pay the piper for an Astron... that is not going to bills 2 way (although reputable, so its said) and spending what? I think they go for $70-80.

Message-ID: <20000805064604.27150.00000267@ng-fm1.aol.com>
Source record: 46940

Hello all, I need your help in finding a "Carrier Oscillator" crystal for a Tram D201 im re-building. Its one of the small ones located on the "Balanced Modulator Board" it controls the AM/LSB mode of operation. I have a spare D201A (Also a Re-Furb) for a friend, but the "Balanced Modulator Board" in IT is different, plus the crystal in that radio is soldered into place. If ANYONE can at least steer me in the right direction.......I would appreciate it. Im also aware of "Maycom Comm" who sells Trams and parts for Trams, But im NOT about to pay his prices, He wanted to charge me $38.00 for both crystals.......the 6.2535 (USB) and the 6.2565 (AM/LSB). (JUST A LITTLE OUT OF LINE HUH ?) OH, and before I forget, the one I need is the (6.2565 AM/LSB) Thanks in advance for any help you may be to me, as always........best regards to you,........73'.........Frank in CT.

I agree... it's excessive input to the base-emitter juction that's blowing
that device.
Changing the input cap to something smaller in value may be in order...

Pardon my asking but.....Who the fuck would want to buy a radio at Rat Shack in the first place? Since when is paying retail+ for a shitty radio a good thing?

> All that black market trade needs
> to cease.

WHY????

>
> Hey I've sold that type gear
> and worked on 'em too.

And your point is??

Still
> I won't miss 'em at all!

Some of us out here that use them , sell them , and repair them will miss them! While all have thier quirks , they brought something to the market that was needed. I will always tell people to buy a radio with the channels in it already rather than trying to talk them into a damn Grant or 148 that would need the tweaking done to it later.

For sale...

Texas Star DX 350 HDV Linear amplifier.
Features include...
AM/SSB switch, variable power control, Receive pre-amp.
Unit has an output power of 150 watts with a 4 watt drive,
I beleive it will do more with a higher drive.
Unit works well and is in good shape.
$125.00 (includes shipping in the USA only)
Click here to see...
http://members.aol.com/TRAMD300/TexasStar.jpg

Please contact me direct.

Thank you...

Save your money and put that thing back up on a shelf where it
belongs.

But you might find a crystal from someone who
keeps old synthesizer rocks. Seems like the Johnsons
had 6 megs in 'em.

467. Re: Tubes?

Newsgroup: rec.radio.cb
Date: 2000-08-05 00:00:00 UTC
From: JR <jr@some.net>
Message-ID: <398C6FE4.C8446B2C@some.net>
Source record: 47008

You can't tell if tubes are good or bad just by the way they look unless it is something really obvious as cracked glass or melted elements. The black spots are a result of the firing of the "getter" when the tube was manufactured. After a vacumn is drawn and the tube sealed, the getter is fired by RF induction to eleminate any gas that is left in the tube. Your not going to get 500 watts out of two TV sweep tubes, not for long anyway.

sideband wrote:

Hey Carl.....The Tram D201 line is one of "Thee" finest CB radios EVER made, Ive seen you respond to other posts regarding Trams, with the same words. It seems to me your one of the following kind of people: (1)- You've had D201's in the past and have had nothing but problems with them because you DONT know how to PROPERLY operate them.....OR.....(2)- Deep down inside you've always WANTED one but have never had enough $$$$$ to buy one, and your ENVY/JEALOUSY is getting the best of you.....so I ask; which is it?.....are you a "POOR OPERATOR".....OR.....ARE YOU A JEALOUS POOR OPERATOR?.....jeez now.....this is getting confusing, (ha, ha, ha,) either way, have a nice day, regards, Frank in CT.

I dead key me 32 pill at 2-3KW and it doesn't get HOT HOT. It gets a little warm like when some one pisses in the pool.

My point is if 4 fans can cool 32 pills one fan can cool up to 8 pills....

PS I dont think I could melt the solder keying my box at 3KW if i did it for an hour with a good SWR although it isnt somthing I plan to do.

481. Save the US: Ralph Nader 2000

Newsgroup: rec.radio.cb

It's hard for me to believe that the next president of the United States will be George W. Bush or Al Gore. Both remind me of Hollywood movies that have been focus-grouped to death: they push all the appropriate buttons, but have zero original vision. Both stand for the same thing: corporate-driven business as usual.

There must be some way outta here.

Ralph Nader is no joker or thief. I think he and the Greens could give Al & George a good run for their money. At 65, Nader isn't running as fast as he used to, and the Green Party doesn't exactly have its platform figured out, but I think they have what it takes to inject a dose of radical democracy into the race. Unlike the two Tweedles, Nader is real, he stands for decency and common sense and he still commands a lot of respect in progressive and activist circles. And hidden behind the rainbow coalition of lefties, eco-feminists and crazies, the Green Party does have some great ideas. It's the only party that stands for the Tobin Tax, true cost markets, media reform and putting corporations in their place.

In October, with a fired-up Nader hurling intelligent sound bites into the presidential debates, the whole game show might actually be worth watching. The alternative is the most sophomoric presidential race in American history . . . and the lowest voter turnout ever.

I'm putting a GO GREEN - VOTE NADER graphic at the end of all my emails from now on. I'm betting that, between now and November, the American people will wake up to the fact that their sacred democratic experiment has now degenerated into a choice between a corporate-sponsored Republican and a corporate-sponsored Democrat.

In these heady post-WTO days, a sudden, massive protest vote against Al & George is entirely possible and Nader would be the most apparent heir. With perhaps less than 25 percent of the people voting, an inspired Nader campaign could grab a surprising share of the action. And even if he does not come close to winning, at least imagine how his campaign might pull together some of the fired-up, post-WTO forces and lay the groundwork for something really visionary in 2004.

Download the graphics and help launch an email pyramid scheme to dump the Tweedles! Two formats are available, a magazine

sticker (17K) or a Banner ad (5K):

==========

What it Means to be Green

"At the root of all Green political action is nonviolence, starting
with how we live our lives, taking small, unilateral steps toward
peace in everything we do. Green politics requires us to be both
tender and subversive. Affirming tenderness as a political value is
already subversive. In Green politics, we practice tenderness in
relations with others; in caring for ideas, art, language, and
culture; and in cherishing and protecting the Earth. To think Green
is to build solidarity with those working for social justice and human
rights everywhere, not bound by ideologies."

-Petra Kelly

hi, I have been a 11 meter operator for about 30 years and currently trying to get my ham license, I was just curious what all the hype is about 11 meter operators messing up the ham bands, this to me does not seem to be a problem ,at least in my area, is it bad in other areas or do ham operators just like to complain, I'm not trying to stir anything up .I was just curious how bad this problem was, 73s craig

TheNoid OR <noid@involved.com> wrote in message

>I'm looking for a good online tutorial and explanation of a lot
> of the CB terms.. and how they work.. MAINLY SWR.. I want to know >WHAT it is.

SWR is a measurement used to tell you if your antenna length is right for your operating frequency. Antennas are somewhat broad band so they usually are set to the middle of the frequencies (ch 20 on cb) to be used.

Most Base cb antennas will cover the 40 channels with a good match over the whole band. Some will even cover 40 channels above and 40 channels below the regular 40 channels. (if you want to refer to them as channels)

The Longer mobile antennas will be pretty good over the whole 40 channels also. A 4ft fiberglass mirror mount whip will have slightly higher swr on the band edges when tuned to channel 20. Some of the hi-performance longer antennas will be a lot more broad band. The 102 inch whip is the most broadbnand and usually refered to by other antenna manufacturers.

With me so far??

> and how I can get rid of it/tune it. what the best levels are. and what causes it

How to tune it....
1. calibrate your swr meter for full scale in the FWD position when you key your mic on your radio.
2 unkey, switch to REF or REV
3 key up, and read the meter.

Lower is better. 1.1:1 is ideal, 1.5:1 is acceptable, 2:1 is where I would stop transmitting and anything higher than that is a bad mis-match. Remember one thing, higher frequencies use a shorter antenna.

Now to tune the antenna. Take a swr reading on channel 1, 20, and 40. If it is 1.1:1 on all 3, don't mess with it.

If it is 3:1 on channel 1 and 1.1:1 on channel 40 then you need to lengthen your antenna to match better on channel 1. (Worse on 1 than 40 means too short)

If it is 3:1 on channel 40 and 1.1:1 on channel 1 then you need to shorten your antenna to match better on channel 40. (Worse on 40 than 1 means too long)

Hope that i kept that explanation simple.

>I wouldn't mind learning about Amps too..

That could take more explaining...Another Chapter/Book

Aww.....so the FCC has a nice little list of illegal transceivers there, well good for them. No, wait, big F-ing deal. I really don't care, at all, and many people don't. The fact is almost anyone can build a radio/make a radio transmit wherever the hell they want to. No importing, no exporting, just hop on eBay and get a type accepted one and figure out how to modify it. The mods are usually on the net or, if you are technically inclined, you can figure it out yourself. Hell, most of the tech guys on this group could probably make a radio do whatever the hell they wanted to, FCC rules or not. Ham radio too. Many books outline all the schems and theories behind big tube amps and the construction of transmitters to go wherever the hell the builder wants. So the builder does not need some sweatshop labor banned in the USA POS. Case in point: A mentally unstable radio operator modified an old TXer to transmit on AIRCRAFT FREQUENCIES. No, he was not coming over the TV, telephone, stereo, toaster, what have you, but over the frequencies used by commercial aircraft. How did he do it? With knowledge, not with some piece of gear he bought under the table. So, what's more dangerous? A CBer with an out of band radio, or some nitwit with a little knowledge and placed together equipment??? Last I checked, you can't really ban knowledge. You can try but it won't work. Show me a list of banned knowledge from someone's head.....

I've had more than anybody should have had. 3. Been
workin' on 'em since the get go back when it all began. YET...

Receiver is good. Almost as good as the Browning MKIII.
The rest of the rig/s is as junky as they get. Bad mixing schemes
Terrible hybrid circuits, trashy SSB and high voltage switching on a Mickey
Mouse relay. Nope. Never as good as a MarkIII.

No comparison to a stock Cobra 2K with a good receiver tweak.

I'd put my 458 against any Trams.
That is legal output power. Anything goes
on the receiver. I'll talk just as far as you will
and hear clearly what you think is in the mud.

You know a good use for a Tram D201A would be
a soft mellow nite lite. Yeah!

95% of all Trams are either in the junk pile or collecting dust. Ya' sound
like they're great because they last and last. No they don't. They break and
you fix 'em and they break again. If there are any working its because
they're on a shelf waitin' for a sale while they're STILL working. Put it in
service and see.

Hello SSB: The amp has two 6LQ6 tubes will not put out 500 watts. I had a Contex 500 once, it had one of those tubes driving four, and it had a hard time making 500 watts. Some CB type wattmeters would show more wattage than what was really going out. This maybe a explanation, of seeing 500 watts?

The large black spots on he side of the tubes is a element that the tube manufacture purposely burns up to improve the vacuum inside the tube. I have noticed that some flat tubes (tubes that are close to death) have a grainy type feel to the glass, where as new tubes has smooth feel.

But be advised the HIGH VOLTAGES in the amp can KILL YOU. Make sure the amp is off, unplugged, and you touched the tube plate cap connections with a screw driver, that has its shaft connected to the amps chassie ground.

If the tubes are not flat and you are driving it with a stock radio, you should see somewhere in the ballpark of 30 to 50 watts output on AM, and around 100 plus on SSB. I'd say your machine is ah workin.

One of the locals up on the hill over looking all of the San Fernando Valley ran a two tube (6LQ6) tube amp and was heard all over the place.

Reading my original post, I could see how someone could assume that, tho...
::grin:: Guess I should have phrased that a bit differently...

I'll bet he did a better job soldering
the PL259's. Also probably rerouted the
coax, and now gets less external interference,
better performance out of his antenna.

Seems like the government could put our tax dollars to much better use in this day and time when there are so much major crime and illegal activities in this country than to pay men to work on such things as what kind of radio a man talks on when he uses a certain frequency. Poor way to spend money . Feed the hungry with that money. Just my thoughts.

I'm confused. God was created in man's image? Don't you mean man was created
in God's image. What's his name and where does he live, God not man.
Please send all info to KC3AU for further investigation.

If the incoming signal is off frequency, I can make them sound better
by turning the clarifier. 99% of the radios are OK. It's that 1% that
the "golden screwdriver" types have messed up.

Actually, if the heatsink design were efficient enough for 2 pills it would apply to 4,8,16 and so on.That would assume that you would provide the same amount of heat transfer media for every pair. Probably not practical since it would require a much larger foot print so the use of fans increases the heatsink efficiency and reduces the footprint of the board and heat sink.

I am curious has anyone with the 8 pill and larger amps with multiple fans ever try running 1 fan then 2 etc and monitor the temp to determine when there is no more cooling efficiency?

528. Misuse of the word "NEW"

Newsgroup: rec.radio.cb
Date: 2000-08-05 00:00:00 UTC
From: Ken Diaz <kenjd@email.msn.com>
Message-ID: <#IA6Waw$$GA.230@cpmsnbbsa09>
Source record: 47081

I was looking at some of the neat items closing soon on Ebay's "radio equipment" listing. I found one chap who is offering a:

"Cobra XX Classic NEW !!!"

I clicked on this item for a description and found:

1. He has hooked it up to his workbench.

2. It has been peaked.

3. It has been tuned to perfection.

(probably his work bench)

I suspect 98% of us think this is not "NEW".

And, when I decide to obtain my next piece of "NEW" communications equipment,

I(a). It will not have been opened and removed from the factory carton to have someone's fingerprints and snot residue placed on the shiny chrome trim.

1 (b) It will not have been opened by some wheezing 300 lb. self proclaimed CB expert (who can't pass an electronics test) just to make sure it "talks" good" for a few hours (days).

1(c) It will not have been opened at the expense of adding small micro scratches or dog hair to the
item or it's accessories.

2. I want the factory tuning job not Joe's "I have a shop near the interstate" version of tuning.

3. I want the factory version of peaked perfection not "Screwdriver Joe".

Anyway, I think most of us can see through this baloney. Just be extra carefull when you see "new". As far as the radio I saw on Ebay, I think the best he should call it is "Mint with modification".

You think it's all "made-up"?

Woo hoo! Have YOU got a surprise coming.

You are SO in DENIAL. What planet have you been on? Fact: this "hobby" involves the use of illegal equipment and practices. At least face up to it - and stop pretending nobody cares what band your on or how many watts you run.

eBay is under order of the FCC to cease trading of these rigs. Check out:

http://pages.ebay.com/help/community/png-cb.html

Or call the FCC numbers at the bottom of the notice if you think it's not authentic. This means that places like CoaxKid, Exports R Us, Copper, and the whole bunch more are gonna have to pull their stock of funny channel CB rigs - or face up to $11,000 per radio per day of fine.

Hmm! Seems that you are upset by something. Factory set CB/Ham wanna-be radios are not always on target. They may be within their specs but try to talk to someone on sideband with a CB/Ham wanna-be radio that is "factory set" and you will get all kinds of interesting responses. Do you know this guy to be a poor technician? If so then that may be important to the group. A lot of shops charge to have the alignment done before it leaves the shop and some even do the alignment for free before selling it. It doesn't say modified, it says peeked. Don't think that any components were replaced or removed or added there. I get really tired of people jumping on a post just to stop someone from buying anything. It happens on the radio around here a lot and I see it in here a lot too. Granted there are some people that are asking 400 for a peice of used equipment still on the market for 250 then its consumer awareness but don't jump all over someones sales tactics just because of one word. NEW. To me this means it has not been mobile or in service. Bench jobs don't seem to me to be a reason to say a radio is no longer new.

' I'm confused. God was created in man's image? Don't you mean man was created
' in God's image. What's his name and where does he live, God not man.

You can get all the info you need at http://www.heaven.gov/. Or, you
can send an e-mail to God@heaven.gov. He usually doesn't reply
directly.

You can receive His broadcast on 999Ghz. Do not confuse this with the
broadcast on 666Ghz. That is the broadcast of the opposition. You
need to be using a scanner that works with polarity modulation. Be
sure to use the correct alignment. Your filter neads to line up so
that the horizontal polarity is in line with your latitude.
Horizontal polarity represents 0, vertical polarity represents 1. You
need to use the Aramaic character set code page. All transmissions
are in Aramaic with no compression used. You may point your antenna
in any direction. The broadcast is a non-localized phenomenon.

Oh yes, there are 3 null characters transmited every 314 characters
for synchronization. The character stream basicly goes 3 nulls
followed by 297 characters of information and then 14 characters of
error detection / error correction code.

You can get full specifications on the signal encoding from:

http://www.heaven.gov/word/broadcast.html

If for some reason you can not access the site, it means you are a
non-believer and will suffer eternal damnation after the rest of your
life.

"Import & Sale" meaning, if you are from
"out of country" IE: USA, you can not
import them to the US for sale. A European
Grant has the Extra channels + FM already.
But a US Grant does not, so as such is legal
to sell here. Read it again before you blow
you're entire load.....

I am glad I posted my original. I am definitely going to go with a single antenna. What about a no-ground plane antenna? I won't drill a hole in the roof of my truck, I'd rather not use a magnetic mount but haven't ruled it out. I was going to put the ngp antenna on the roof of the fiberglass cap with a large piece of plywood on the inside of the cap roof for support. Any thoughts?
Thanks for all the help.

540. FS: Misc. Test Equipment

Newsgroup: rec.radio.cb
Date: 2000-08-05 00:00:00 UTC
From: mystique224@home.com
Message-ID: <398C6E7E.C0BB9F45@home.com>
Source record: 47093

I have the following:

- HP 403B Voltmeter with complete manual (Ex. cond.) $75
- Eico DMC-1 Capacitance Meter (Ex. cond.) $25
- Heathkit Frequency Counter 225MHz (Ex. cond.) $85
- Eico Power Supply 0-30 V @ 1A $10 (only goes up to about 22V
though, think someone repaired it before and modified it with a
different part) Works fine though
- RLC Variable Attenuator 0-120 dB in 10 dB steps, 50 ohm BNC
connectors, Ex.
cond. $70, Retails for $130
- Two BIRD Wattmeter Slugs 50-125MHz 50W & 100-250MHz 50W Both Used but
in Ex.cond. Both for $85
- One brand new (unused) Eimac 3CX800A7 Power Triode Vacuum Tube Bought
new for $329 will sell for $225

That is pretty much the list. They are pretty much items that I have
bought at one time and rarely use anymore. The tube was bought to retube
an HF amplifier in which the person owning it changed their mind. All
items
will be shipped 2-3 Day priority mail. Sorry I have received too many
beat up
boxes via UPS and don't use their business. Buyer pays exact shipping
charges
plus $3.00 for insurance. I will guarantee all items non DOA unless
insurance
is buyer denies insurance. Pics are available upon request. Email if you
have
any further questions.
Thanks,
James

P.S. - I will also except trade offers.

<< "Import & Sale" meaning, if you are from
"out of country" IE: USA, you can not
import them to the US for sale. A European
Grant has the Extra channels + FM already.
But a US Grant does not, so as such is legal
to sell here. Read it again before you blow
you're entire load..... >>

The actual quote (stated several times in the FCC document) is "import OR MARKETING".

Marketing means selling, plain and simple. It does not have to be connected with the importing process.

Please read the body of the document. It specifically cites rigs that have CB capability engineered as a simple mod, whether they are modded at the time of sale or not.

There is no "loophole" that will make it legal for you to sell these rigs over the web, in a truck stop, or from your garage.

The FCC does not want these rigs sold.

The FCC does not want these rigs used on CB.

Accept it.

Accept the fact that you are on the side of the outlaws - and stop whining about technicalities and loopholes that you think make it legal to transmit anywhere you please.

I guess the tech is out of the question. he is the one that modafied and tuned it when I bought it new. It is a clear sounding radio though. I guess I could get a 20 watt linear :) I was hoping I could just turn some of those varible resisters in there to get more watts. Would using a power mike do it any good?

In the spirit asked, I will attempt to answer your question at least from my POV.

Like a collection of six-year olds, any group of hobbyists will mill around, form a pecking order, and more-or-less piss on the lower peckees while telling them it is raining. Being an unlicensed service, CBers are automatically at the bottom of the amateur totem pole so bring an umbrella. While there are some old farts who will look down on anything, the majority of the heat will come from those who just got their codeless tickets. There ain't no teetotaler like an ex-drunk nor a proselyte like a recent convert.

Freebanding is not particularly new nor are CBers taking the amateur exams. When I lived in St Louis in the 70s code practice was at 27.495. We ran a Prevert Net on 28.600 (leading the nation to greater heights of preversion and, yes, I can spell) and were regularly broken into by assorted yokels whose rationale was that they had bought the crystals and they damned well intended to use them. By and large we did not give a hoot one way or the other but we simply cannot talk to unlicensed stations; both Part 97 and the international treaties forbid it. No one is being snooty but I do not risk my amateur and commercial tickets -- remember this is about 1975 so we still had commercial licenses.

I have personally taught about a dozen CB outlaws and see some of them to this day when I get back to StL so it is not like all hams think you have a social disease. I probably owe my Extra to a couple of them: weren't no way they were going to get it before I did. As it happens, I talk for a living so I restrict my hobbies to things that allow me to shut up and listen so I do not generally run 'phone - amateur, CB, or cell.

Several things have changed in the period: a. the spots are up and there is dx on 10. b) Technician class amateur licenses now have 10 meters, c) the CB side of the house has picked up some first-rate dipsticks with more money than sense, d) the Amateur Service picked up the 24.89 - 24.99 band, and, e) enforcement collapsed. When the 27 MHz frequencies were cleared to extend CB up to 99 channels it allowed freebanding up to 28 with no resistance so

things kind of got out of hand. With your experience you more than likely know more of this than I do.

So how do Freebanders interfere with the ham bands?

a) Being there at all. As noted you will not be and cannot be accepted as equals nor will you ever see a QSL card from a foreign amateur station except by mistake. The amateur rules forbid it worldwide. Incidentally, the old FCC monitoring station at Grand Island NE was perfectly capable of ranging Nazi subs within a square mile of the Atlantic in 1940; they put it on the cable and sent them from Bermuda so it looked like the Brits. The feeling of invulnerability is more a result of budget cuts and priorities at the FCC than a lack of technology or authority. It might not last forever.

b) while over-cranking the audio on dx is a problem common to both groups, it is much more pronounced and common among the 27 MHz side of the house as is the operation of equipment better suited to be landfill and boat anchors. Being there spuriously is not a great improvement.

c) while the average two-meter repeater now sounds like a circus calliope, things like roger beeps are not generally considered to be as 'cool' on 24 or 28 MHz as they are on 27. The operating practices of both groups are not that different nor all that sane in any case but it is customary not to impose one's tastes on the other group if one does not expect some hostility.

d) the same small-penis brigade that one encounters on the newsgroups sometimes show up to simply raise hell with the 'enemy' and prove their non-existent manhood. That is a common problem to both sides of the house but you have us outnumbered and we couldn't make a bigger mess of 27 MHz if we tried.

Hope this is at least responsive to your question. I got curious and punched up this group for the first time in months and I will kill it again after I send this so flame away. My bozo filter will handle the e-mail so I have no problems putting my real name and call sign on it.

Good luck with your exams!

>
>

That's irrelevant. You're countering an argument that wasn't made. The
point was that calling this radio "new" is misleading. If the buyer
wants to get their new radio peaked, they should choose who to have do
that for them. Do you just trust your car with any old mechanic? Would
you let me take your car in for you and have it tuned up? Or would you
prefer to do that yourself? And would you not agree that if I take your
new car in and have my buddy "tune" it for you before delivery that it's
no longer as the factory produced it?

In metropolitan areas CBers frequent the lower portion of 10, mostly
the cw portion. In NYC cab companies also use 10 but they have started
cracking down on them big time. Niether group belongs there. Riley
promises to go after them this year, I hope he bags a bunch.

it is funny you should say that, i was watching wwf one night and they
always show their establishment on times square. and one night there in
front of the camera was a yellow cab with a 102 inch whip on the roof,
well i never,.....cd is out.....

The performance between the Wil1000 and K40 are a wash.
However... the Wilson is more robust mechanically.

People who find humor in a tragic disaster need to invest a little time in introspection. They certainly have little or no respect for others, and that might be reflected in other aspects of their lives as well.

Hello Gary: Go with the Wilson 1000. Its a much better antenna.

Hello Professor: Dead wrong again! Who do we believe, the long time antenna designers at Wilson, and the Lockheed Rye Canyon Antenna Test Engineers, or some guy who calls himself Professor?

It is difficult to measure only a few dB difference between antennas, but it can be done. The Boys at the Rye Canyon Antenna Test Range can tell the difference of .1dB or closer if they half to.

I am sure the boys over at Wilson knew what the differences in field strengths, were before they paid a chunk of money to Lockheed. Wilson simply used the Lockheed Antenna Test Range as a independent antenna measuring source, for a written antenna comparison report, to write their great CB antenna add. Maybe you have measured the different antennas on your antenna range, and have different measurement results?

Jay in the Great Mojave Desert, ...just down the road ah ways from the fillin station.

In an unmodified radio, under normal operating conditions, the clarifier has
no effect when the radio is being used in AM mode.

Some folks have had their 11 meter rigs illegally modified to operate in frequencies above and below those allotted to the CB service... As a result, some of these outlaw operators infringe upon the lower end of the 10 meter band, which is used for CW, and other digital modes by Amateur operators. Can't really call these criminals CB operators, as they don't always use CB equipment to do so, and obviously aren't operating within the rules as set forth by the FCC in Part 95. I simply refer to them as what they really are - criminals.

Good luck with your studies...

>in use would the lack of traffic on the band increase the range of the signal?

The amount of "traffic" on a frequency has little or nothing to do
with the distance the signal travels... It very well could affect how far
away the signal could be heard, but only be reducing the level of ambient
"noise" on that frequency. The "range" really is not a function of the
transmitter, but of the receiver. A radio signal, like any other
electromagnetic emission travels forever once it's been transmitted unless
absorbed by some object (atmosphere, water, land, black body, etc.). It also,
however, attenuates with distance so that at two points remote from the
transmitter, Point A being x miles away, Point B being 2(x) miles away, the
signal strength at Point B is 1/4 that at Point B. A more sensitive receiver
will pick up a signal farther away than a less senstive receiver - provided
that the receiver is able to distinguish that signal from the ambient noise.
So, if you are at a point in the world with little or no other CB traffic and
you transmit a signal, you could be heard by someone 100 miles (160 KM) away
as long as conditions there were quiet, but only 50 miles (80 KM) away you may
be lost in a jumble of local noise and/or skip.

well you go ahead and vote for this moron. he goes around crying about big business but makes a bundle off the stock market, investing in big business. the guy is a worm. he has been around for a long time crying the sky is falling. he made a living off of being a 'friend of the people'. well he needs to retire and take all his silly little anarchist friends with him. they and he will never be happy about anything unless we are living in caves, thinking correct thoughts and eating with our hands (vegetables of course), that is if it is still ok to eat vegetables. of course nadar and his silly bunch may find a way to prove that my artichokes are in pain when i cook them in my microwave. stay tuned. personally nadar and the green party need to go back to europe where this stuff started and whine over there. then maybe the green party can tell the eec to pay back all the money they owe us for world war 1 and world war 2, and having to save their collective asses time and time again. green party my ass, give me a break,.....cd is out...

For reasons I cannot fathom, you apparently have a case of the tights with the Amateur community. Coupled with what appears to be a total lack of knowledge, this could be dangerous. But Craig started this with calmnity and dignitude so I will continue in the spirit. Picture for a moment the following situation:

1) the spots are down and F2 propagation on freqs much above 20 or so ends until the next cycle if any.

2) With HF clearing out, the various radio poobahs expand the international shortwave broadcast bands and amateur frequencies mostly to have some activity and keep the freebanding to a gentle, ladylike belch. Eleven meter freebanders overestimate their importance in the scheme of things.

3) the code test disappears. Probably not for a while and 5wpm is pretty trivial anyway unless you let your knickers get tied in knots over it. So you are about a 105 multiple guess questions from the whole Amateur enchilada; with a pretty simple code-test should you choose to do it now.

Questions for you, sir:

1) Does this wind your clock in any way, shape, or form? Why or why not?

2) in what way does doing one preclude doing the other? Seems a lot of people do both. Both hobbies have multiple aspects to them but there really is no competition I can see. Perhaps status games but everyone is a rookie once -- as I would be on 11 after being licensed for 45 of my 56 years. Big deal.

3) Do you think any significant number of 11-meter people would make the jump? Why or why not?

I am not trying to bag you. This discussion goes on on the amateur newsgroups all the time and I am just looking for real, live data. My prejudgement is that things would stay pretty much the same if amateur licenses came in Post Toasties boxes. Right?

even though the hams can get cocky at times, i have to admit that if it wasn't for some of the hams in this group, i probably would not have become so familiar with the hobby... they're always quick to answer my questions, no matter how silly they may be.. there are some very nice people in this group and you can't let the 1 or 2 sour apples ruin the whole thing..

All I have to say about all this is, "to each his own." Before you get on us 11 meter boys and are toys, clean up your own back yard. As far as getting my ticket, I might. I have studied the test for "tech" class and found it pretty easy actually. If I did take the test I would do it so I can say I did and still do what I am doing now, work 11 meters that is. Its like voting, I just do it so I can put in my too cents when taking politricks with people. Otherwise they say, " well you didn't vote therefore you cant give your opinion." I am on 27.0?? and I get pissed when local ear pluggers get on the band talkin shhht, making noise, throwin dead keys. But you know what? oh well, I will do it another day a different way, I dont dwell on it and call the FCC whining about it. We had one guy who was getting ridiculous, we triangulated his ass and when we found him we strangulated his ass, end of problem. Dont let a couple of bad 11 meter apples spoil the whole bunch. Just grow some nutz and go over there and take care of your own buisness if your so hung up on it. Take heed, the guys I know on 11 meters don't play that shhht and will have there own kind of welcome mat waiting for you if you know what I mean. Just make sure you differentiate between the REAL problem and people who like to shoot skip and drop the maul once and a while.

hey slick , what the hell are you talking about?????? where the hell
do you think the term , 'elmering' came from???????? the concept is
from you old hammies helping out the newbies, but we want to make sure
each and every hambo is well informed and knowledgeable about all rf
subjects ,but please don't ask any damn questions about amps until you
are allowed to , because hammies are JEALOUS of their knowledge or
supposed knowledge and when you skip ahead of what they deem to be the
correct program , it pisses the powers that be off, BECAUSE THEY FEEL
YOU HAVE TO PAY YOUR DUES FIRST ACCORDING TO THEIR TIME TABLE, BUT THAT
IS NOT HOW LIFE IN AMERICA IS , IS IT??????????????????????
sooooooooooooooooooooooooooooooooo.....know your role and shut
your mouth, good buddy,.....cd is out.....

<< My prejudgement is that things would stay pretty much the same if amateur licenses came in Post Toasties boxes. Right? >>

Right. For a lot of people, the ham/cb issue is moot:

- Lucky residents of certain small towns and rural areas where the CB channels are not too crowded and people can actually have civilized conversations on CB at most times of day or night without being terrorized by high power bullies and channel masters.

- Freebanders that take the 60 question multiple choice no-code Tech test, get a ham call, fool around on 2 meters for a week or two, and promptly go back to freebanding. Most often heard to say "Hams aren't gods. I'm a ham and I freeband. Every ham does it".

- General and Extra class hams that get on CB to lord it over the rabble. Makes 'em feel superior, and they get a kick out of spouting their knowledge of radio theory to the Great Unwashed. Most often heard to say "I'm a ham, but I like to keep in touch with my friends on CB".

- Hard core losers and societal rebels dedicated to anarchy in the radio spectrum who happen to have a ham license. Often build/sell high power amps for their buddies to use on CB. Most often heard to say "I don't believe in government rules. My guns (or "Gods Law") is all the law I need".

- Hams who have a Tech business on the side. They make a nice steady little income from selling export radios, doing mods, peaking jobs, and CB amp repairs. Most often heard to say "What goes on on CB is none of hams business. Don't rock the boat"

>(probably his work bench)
>I suspect 98% of us think this is not "NEW".

Many CB'ers have a radio peaked after they buy it. Many shops sell new radios
already peaked to save the customer the hassle of waiting the extra time.
Sure there are some hacks out there, doesn't mean everyone is.
If I buy a new car, I'd like it to already have a state inspection and prepped
for sale, not with the plastic film still on the hood and roof and all over the
seats, not cleaned up, etc.
I guess different strokes.......

599. CB distance w/ no traffic

Well, it isn't a problem until you get some local dork with an overdriven, modded out the kazu radio driving an overdriven amp splatter box, and splatters all over several hundred kHz, including the 10 meter band. Or the other brain-dead operators that come up into the 10 meter band to operate.

The post he quoted was dated May '99.
Thay have yet to be able to push this ban through the legal system, that's why every CB shop, truck stop, and distributor in America is still selling them.
So what if they (our village masters) ban those radios, wouldn't you rather cb'ers buy used Kenwoods, yaesus, and Icoms?
Imagine all the freebanding then!
Just expand CB from 25.615 to 28.305, AM/FM/USB/LSB and 1500w and be done with it.

Again Toll Free you are off your rocker the alternator is running 3 phase ac to the rectifier you can get away with 4 guage wire from each alternator to the rectifier. then depending on your run.. I guess guys like Ghostrider and BB arent using the right wire but they win everytime... they use 4 guage. We all know bigger is better but 00 is slightly more than overkill...and will hurt the pocket book ...go to your nearest electrical distributor and get your self some 3 conductor 4 guage it is easier to run and more than adequate ...

cookie better watch out for Pit Bull ...
he already took 1 ass whoopin...

>
> Because they use the improper ferrite to begin with in their transformers.

So who the fuck is using the right ferrite? you tell me cookie or messenger
what mix are they using you can use 43 , 63, 77,61 all with the same turns
ratio.. mr knowit all...

>
> Not really. They sure do LOOK a lot better than the others, though. I
can
> clip a resistor in a
> Texas Star 250 and see app. 500 to 1kW of output on the Bird.
==========
See you need try to resort to tricks to fool people and yourself .. which
is it 500 or 1 kw that is a pretty big differance ? What will it show on a
peak meter at these numbers you need to look at both not just rms figures ?
>
> Wattmeters are bullshit for anything other than a reference point, and a
> lousy one at that.
==========
If 2 amps are compared on the same watt meter then what does that mean..?

> The amount of turns has NOTHING to do with the bandwith, unless you are
> using the improper
> mix of ferrite for the band(s) being designed for.
==========
you are a real joke now xforce and davemades are using the wrong ferrite mix
..

>
> Dave and X-Force (and the other battle box builders) use ferrite designed
> for a completely different
> frequency range. Therefore, they have to forgo the "correct" LC ratio,
and
> turns ratio. They make up
> for that "incorrectness" by LC circuits elsewhere, or in the combiners.

---
where is the combiner in a 2 pill? how about a lc network in a 2 pill or 4
pill where are they ..

>
>
> Zcollector=(Vcc(Vcc))/(2Pout)
>
> Therefore, you see different impedances for different levels of drive,
> output, and voltage.
>
> And each transistor is different because of the difference in collector
> reactance present.
==========
Way to try and sidestep the question... you said they were 4 ohms i beleive
was that a lie or is this post a lie ?

>
>
> >
> > ... I can take and build 2- 2 pill stages at 2 wraps each and combine
> them
> > with a 2 port combiner *- and tune it with a LC network at 27 mhz which

>
> We?? You got a mouse in your pocket?
==========
No just a big dick ... Were did i use the word WE? I said prove to us the
people out on the NG the ones you are so greatly trying to impress or how
about impressing the boys at the next big break and build something they can
key with or against because talk is cheap we get that all day long on the NG
...
>

> I got out of transistors long ago. Once something is mastered, the master
> moves on, and goes to play with tubes.
==========
what have you mastered ? what is your claim to fame with transistor amps ?
who are you other than someone who talks alot on the NG ? has anyone bought
your amps ? has anyone besides yourself used one... Perhaps you and
professor should team up with all the brain power you both possess you can
certainly leave your mark on the cb world ...

>
> Peek, how many turns you using on that 750 Bird watt 2 pill you got?
---
wow to bad he didnt use it at the last keydown ... who did he lose to ??
because i havent seen his name on or in the winners circle at any keydowns
this year 750 bird watts with a 10 kw slug ...

>
> And what transistors you runnin?

>
> Cookie boxes seem to eat DaveMade around here.
>
> Guess we HAVE found something better.
==========
too bad they arent doing it at any breaks ... and it is also funny all the
fellas in louisiana don't say the same thing maybe they only work in texas

>
>
> Some of us build for people that actually USE the head God gave them,
those
> that shut their Fing mouths and
> listen when someone smarter then they speak.
==========
well who is the last person to win a keydown using one of your amps please
tell me who he is ... I would like to fucking know...

>
> You should learn that lesson, Einstein.
==========
I have learned a lesson you are an apparent asswipe... see i learned the
meaning of apparent...

Einstein is out....

The K40 is more versatile. It comes as a trunk mount which allows you to add the K40 magnamount for $20. You have to buy a whole mount/coax assembly with the Wilson at $49!!! The K40 also allows you to adjust it for proper polarization if the mounting surface isn't flat. Performance wise, the K40 receives BETTER and CLEARER than the Wilson. As for the comment about antenna height, yes the Wilson is a couple inches shorter BUT thinner (3mm bottom that tappers to 1.5mm at the tip,) the K40 whip is heavier (3mm untappered) and thicker!!! and everyone knows that LONG and THIN goes too far in, SHORT and THICK does the trick!!! I bought into the "Wilson hype" last month and bought a Wilson 1000. I put my K40 back on the car 2 days later!!!

well you can get a 3 element maco beam for $135 from copper with shipping but then you wou need at least a mast and a place to bolt it to, a tripod, and then a rotator. All about $350 when done with that. A 5/8 wave antenna like the I-Max 2000 would be best for local work as it has a low angle of radiation so it covers more ground. They sell for about $70 plus oversized shipping. Then you still need a mast, about $20, and coax, about .75 a foot for lower loss coax, or .27 a foot for the rg8u mini that works fine for runs under 75 feet on the CB band.

That latter of the 2 would keep you under $200.

Andy,
Coax grade isn't just for how much power you run. The better the grade, the lower the loss, the better you here, the better you talk. RG-58 is extremely bad for VHF as the loss is like 6db per 100 ft. So 3 db on your 50ft section. That's half your power leaking out your coax and not being radiated by your antenna. I would at least use the rat shack rg-8/u mini as it's loss is at 3.5 db per 100ft. RG-58 is also more susceptible to outside interference because it has less shielding.

Mike C.
N7UIC

Andy in RI <riradiobuff@aol.comspamsux> wrote in message news:20000804140411.23978.00001518@ng-cs1.aol.com...

And what tests have you done on these? How do they compare on a short run that
this guy is talking about with low power? I use RG-58 for my VHF antennas because the radio the antennas are hooked up to only puts out about 12 watts,
and the coax is only 50 feet long. For my HF rig, at 350 watts, I use RG-8...

I'd be interested to see the results of the tests that you ran to show the difference between the types of coax.

You think it's all "made-up"?

Woo hoo! Have YOU got a surprise coming.

You are SO in DENIAL. What planet have you been on? Fact: this "hobby" involves the use of illegal equipment and practices. At least face up to it - and stop pretending nobody cares what band your on or how many watts you run.

eBay is under order of the FCC to cease trading of these rigs. Check out:

http://pages.ebay.com/help/community/png-cb.html

Or call the FCC numbers at the bottom of the notice if you think it's not authentic. This means that places like CoaxKid, Exports R Us, Copper, and the whole bunch more are gonna have to pull their stock of funny channel CB rigs - or face up to $11,000 per radio per day of fine.

I think the real interesting issue here is the difference between Internet hams and real world hams. All the hams I have talked to in real life, at the VE exams, on 2 meters, at hamfests or any other place besides a newsgroup were just some of the nicest people ever. I actually remember talking to some real nice guys on an IRC chatroom once. Oh, wait, Gary you had something to do with that. Remember getting on my back for asking a question on your coveted rec.radio.amateur.misc and not posting my real name???? That was damned interesting. Real friendly response to a newbie there. Didn't think I would forget that, did you? Well anyways, it just seems that the bickering that goes on here and else where in NGs doesn't transfer over to "the real world" of radio most of the time.

Source record: 47119

Who cares?

Is your computer/news client an unlicensed transmitter per FCC rules?
It's a free internet, and anyone can read any group they want, at any
time they want, and post to it as well! That's the whole point.

In fact, I'm kindof glad there's HAMs here... If not for one or two of
the HAMs in this NG, I would have never thought to get a fiberglass
fishing-rod pole to replace the PVC I'd built my dipole on, and I
wouldn't have made that Johannesburg contact on 38USB a few months
back...Yeah... South Africa. (So sue me, he was there, and so was I).

I've learned alot from the HAMs here, and I hope to learn more, and share
what I now know because of them.

My advice: Sit down, shaddup, read and learn what you can from what they
have to say... and if you don't like their attitudes, remember it's
CB'ers with attitudes that help to perpetuate this mutually
non-benificial arrangement such as evidenced herein.

Just my two cents.

630. HELP!!! How do I stop Fuel Pump interference?

Newsgroup: rec.radio.cb
Date: 2000-08-06 00:00:00 UTC
From: scruit@nospam.yahoo.com
Message-ID: <398ddc75.853410281@90.0.0.1>
Source record: 47121

Hey all,

I just installed my UNiden Grant XL CB in my Ford Taurus with a
mag-mount antenna on the trunklid.

I'm getting interferance from the fuel pump that is so loud I can't
use the CB. Also from the blower motor.

The interferance is coming through the antenna - not the power supply
- I proved this by running the CB from a spare car battery and still
got the interference.

I put a ground strap from the trunklid to the (trunk-mounted) battery,
with no improvement.

If I start the car (and I can hear the fuel pump interference) and
then go to teh back of the can and grab the metal base of the antenna
then the interference goes away as long as no other part of my body is
touching the car.

So, what is going on? Do I have a bad ground on my antenna? It's a
Radio-Shack mag-mount with a capacitive ground. Would I do better
with a real grounded antenna?

Thanks,
Grae

Check to see that your coax is not running near any other relevant electrical wiring. Find the wiring feed to the electric fuel pump and jump a .01 mF cap across the two wires. Soldering it in would not be considered overkill. Also, make certain that the radio is wired and fused directly to the battery and not through the fuse panel.

Here a question I really would like a answer for.

What's worse, if your a CB operator on a Amateur rig talking on 11 meters running heat, or a Ham operator with his ticket running power on 11 meters?

Would the authorities come down on harder be cause your a Ham and Ham should know better, or a CBer for that matter? Which direction would this scenario go? and why? Yes both are breaking the law but who would be dealt with more server and why?

i tell ya dan, this wont be the first time ive called you a real piece of work , and it will not be the last. I dont know what crack pipe you been hitting lately, but it shows...Whateve dilusions about elmers you have , you can flush down the toilet with the rest of your education..Ive seen over 100 people get their tickets without the use of an elmer. I would like to know more about these "dues" that you feel someone has to pay according to some imaginary "time table". I dont know anyone who is jealous of their knowledge, wether its radio hobbies, or a college degree. Im sure i speak for a LOT of people in this newsgroup when i say SHUT YOUR STUPID FACE !!! I am so sick of seeing tiny little words squeezed from your narrow little immature mind. It would have been much more profitable for you to sit there and look retarded, than speak and remove all doubt.Why dont you visit the ARRL site next time before you speak on a subject which obviously you are quite clueless about.
This is the year 2000, the age of the elmer in which you speak, has gone long before your parents gave birth to your dysfunctional self.
Like i said, this isnt the first time ive told you to shut yer stinking maw, and from what ive seen from this string alone, it is far from my last.
Anyone else wanna rip junior a new ass... cause cd..you are out ....

Since we are discussing K40s, I have a K40 mag mount (I need to swap it to different cars occastionally thats why mag mount) thats about 10 years old, and seems to work ok. Is there anything different on the new ones that would make it worth upgrading?

NG

>The K40 is more versatile. It comes as a trunk mount which allows you to

I wouldn't know the Real Problem if it drove over my toes on its tricycle
because I basically don't care a whole lot. I tend to ignore things that
don't get me paid, laid, or fed and 11 meters doesn't do any of them nor for
that matter does 15 where I like to hang. The cold, logical reasoning you
mention re the local pains in the drain takes place everywhere mikes exist
but it gets a little hard on the knuckles when applied about the head and
shoulders. As far as the rest goes, it is good that there is a statute of
limitations on assorted crimes because I have committed most of them. I was
on 11 when it was a ham band -- bootlegging on my Tech ticket. I don't
judge unless stating the obvious can be taken that way.

My interest in this is to confirm the belief that if the FCC gave callsigns
out for the asking, not a whole lot would change. Thank you for the

civility.

Joe, do I detect a little bit of jealousy?? Dual 10' whips!! HAHA,
Joe.. do you even know what the hell you are talking about here, or are you
just pissed cuz our equipment is better than yours. Oh, wait, let me think,
Kenwood vs Uniden???
Icom vs Midland?? hmmm, no Joe you are right, your stuff is better. Lets
look at the legal side of things....

a. we can legally transmit with 1500 watts (here in Canada anyway)
b. we have more frequencies available to us, so when your piddly CB band has
no "skip" hehe, we can always go to 20m (that means 14 MHz) or any other
band where there still is propagation (that means skip, i.e. DX)
c. not all of us HAMS use HT's

I always read this ng when I need a good laugh. I am all for helping
someone out with their radio related problems, CB or amateur, as many hams
have given me advice on problems I have had only because at some point they
had the same problem. So stop your damn complaining and be thankful someone
is here to hold your hand when you need it!

Oh, btw, I got my ham license because I got sick of listening to all the
profanity and guys with their mics turned up so high they squealed, echo
boxes, roger beeps, I could go on.

Maybe the should rename the citizens band the "amateur band"

...and I'm QRT and standing by!!!!! HEHEHE

Thank you for the civil response. For the most part I think you have it right. Hobbies tend to create pecking orders -- remind me to tell you of my forays into RC aircraft, an anal group if there ever was one. The great fear on the ham bands seems to be an invasion of 11 meter Visigoths with roger-beeps and assorted attitudes that will pollute the pristine bands. As you point out, things aren't all that pristine to begin with and haven't been since the Titanic. If tickets came for the asking, I just do not see a lot of people asking. I gather you agree. Thanks again.

From: kg4fdr <kg4fdr@mindspring.com>
Message-ID: <8mktsf$9jh$1@slb7.atl.mindspring.net>
Source record: 47142

No takers at $125, so I am lowering price.

One - almost brand new President Grant rig with around 80 channels above 40 and 40 below. 10 turn clarifier and tuned up. All work done by a professional !!!
This is one nice AM, LSB, USB rig with original mike, mounting bracket, and power cord.
Looks a 9.5 out of 10.

$105 (shipping included to USA) for a quick sale to someone who can pay with Paypal within 24 hours.

I will not accept any other payment method. I will ship the day after payment is sent. If you tell me to hold it you have 24 hours to pay and then I sell to the next person. Sorry to be like this but...
I listed this a few weeks ago at $130 without shipping and got several takers, none of which have sent any money yet, that is why I am going paypal only.

This is a heck of a deal on this rig. Rig was $185 new and $75 worth of mods done to it. Used for only about a month. This rig has never been in a vehicle, base use only, non-smoking environment. Need to sell quick.
Please check my feedback of 278+ on ebay to be sure I am honest. I would list it there but can't mention the extra channels. Rig 100% guaranteed to transmit and receive perfect.
Thanks,
Mark

My, my. Ask a civil question and the Censors of the Freeband rise up like
mushrooms after a rainstorm.
Craig asks a civil question and gets a blast. You might want to consult
with your spiritual advisor just why it is that the very mention of getting
a ham ticket causes a reaction similar to Dracula to a garlicwood cross.
When you get an answer by all means keep it to yourself.

654. Re: how do 11 meter operators bother ham operators

Newsgroup: rec.radio.cb
Date: 2000-08-06 00:00:00 UTC
From: Daniel Friedrichs <dan@willinet.net>
Message-ID: <398E03C2.748614F@willinet.net>
Source record: 47145

Techs don't have 10meters, they have everything above 30mhz (10 is lower then that). Perhaps you ment 6 meters.

If your going to spend the extra green for a good antenna like a Wilson, get a Wilson 5000. Compare the construction of the K40, 1000, and 5000, look at the demo cutaways of each and you'll see for yourself which is the best. If you want the best antenna and have room use 102" whip.

I started CB'ing before I became a Ham, funny, through CB'ers that were also Hams I became one.

Not only did it get me interested in Amateur Radio, it also made me a better CB'er.

674. WTB CD of Amp Circuits

Newsgroup: rec.radio.cb
Date: 2000-08-07 00:00:00 UTC
From: RICK COLE <vk3ym@iprimus.com.au>
Message-ID: <398da783@news.iprimus.com.au>
Source record: 47165

I was surfing the CB websites one day and came across somebody that was advertising a CD full of circuits for RF Amplifiers that were used both on CB and Ham...unfortunately I had a computer crash and lost his address etc so I am wondering if anybody can help me relocate this CD...it is a commercial product as I recall...All I need is information to be able to purchase this item so would appreciate any help I can get in locating the details of it...
thanks for reading
Rick

They are bored and have nothing else to do.

.....
.....

What's up with all the HAMS hanging out in here lately? Isn't there a Hamfest going on somewhere? Shouldn't they bill tuning up their dual 10 ft whips, or studying their morse code? Why don't these freaks go back to playing with their HT's, and go away?

<<ILLEGAL CB TRANSCEIVER LIST:
PRESIDENT - models: Grant, J.F.K., Jackson and Lincoln >>

<< No takers at $125, so I am lowering price.
One - almost brand new President Grant rig with around 80 channels above 40 and 40 below. 10 turn clarifier and tuned up. All work done by a professional !!!
This is one nice AM, LSB, USB rig with original mike, mounting bracket, and power cord.
Looks a 9.5 out of 10.
$105 (shipping included to USA) for a quick sale to someone who can pay with Paypal within 24 hours.
I will not accept any other payment method. I will ship the day after payment is sent. If you tell me to hold it you have 24 hours to pay and then I sell to the next person. Sorry to be like this but...
I listed this a few weeks ago at $130 without shipping and got several takers, none of which have sent any money yet, that is why I am going paypal only.
This is a heck of a deal on this rig. Rig was $185 new and $75 worth of mods done to it. Used for only about a month. This rig has never been in a vehicle, base use only, non-smoking environment. Need to sell quick.
Please check my feedback of 278+ on ebay to be sure I am honest. I would list it there but can't mention the extra channels. Rig 100% guaranteed to transmit and receive perfect.
Thanks,
Mark

I was gonna say the same thing! Turn on the ANL/NB switch.
If that does not work, then no other CB radio is going to suppress the noise
either because the Uniden Grant LT has one of the Best if not the Best ANL/NB's
out there today. It means your car's electrical system is real noisey or like
you
were guessing, your coax/antenna grounding is not exactly grounded properly.

824, out.

HI

Whatever CB u get try to get one with SSB . It may cost a little but more but it will be worth it. SSB permitts you 12 watts PEP rather than only 4 watts on AM mode. Due to increased power and the fact that your transmitting and putting the power on one of the sidebands instead of the carrier and sidebands, yoru SSB signal will travel further than am signals.

Also, you will want to get the biggest antenna possible.

Depends on the RG58, some has very good sheilding. If the rx gets better when
you change from 58 to 8 in a mobile you had a kink in the coax somewhere.

15pf may be a bit much, try a 5 pf or try a gimmick capacitor made of a couple of 1 inch pieces of insulated hook wire twisted together. If there are two diodes coming of the cap with one going to ground and the other going to the base of the transistor try removing the one that goes to ground. This will halve the amount of voltage being fed to the transistor.Make sure the suppresor diode across the relay coil is good. You can also try putting a resistor in series with the base of the ttrransistor. Start with about 1000 ohms. If it will still key keep doubling the value till it wont. Then go back to the last value where it would.

Anyone got any good web sites for info on beefing up auto electrical systems.I'm looking for ideas on what others have used to supply their high current needs including any fabrication or modifications,whether conventional or not.I know enough of the basics and have had some experience in this area,but not enough to know whats available out there,that isn't found in the normal auto parts store.

Thanks for any recommendations
Alan

All those old tube radios break down more often the solid state rigs. They are all 20 years old or more by now. Mostly it's the age drying out the caps causing the reliability issues. Tubes can take one heck of a beating before they go weak, and even then, it's mostly the transmitter output tube and the final audio amp that weaken. Personally, I like the sound of a glass rig. They are just cleaner than the average solid state rig, even though they don't do the power. Glass amps have an incredibly clean tone to them when operated properly, much nicer than any trashy class C transistor amp. AB transistor amps aren't bad though.

PS, I agree with the TRC-458 being a talker. I owned one that would blow away any Galaxy rig for audio, clarity, and recieve. That was one of the best rigs Realistic ever produced (all thier good ones used Uniden boards I might add). I have all sorts of rigs over here ranging from stuff as old as an E.C.I Courior 1M and a Sonar FS-23 to an RCI 2980 and a Cobra 148 FGTL. My favorites are (in no special order) a Robyn SB-520, a Tram Titan, and my D201. Each has it's good points.

Yes, I also own a Cobra 2000 and regard it as one of the most over-rated radios ever made. Don't get me wrong, it works well, but it's not worth all the hype I hear about them. For what it's worth, buy a 148 GTL without the sound tracker crap and you'll be just as happy (same radio inside).

It was your idea to post bullshit from eBay as if it were the FCC gospel, so why should we do your homework for you? If this is the FCC position, why can't you find it posted on their website? There's no reason for each of us to make a phone call to have the rules interpreted by the enforcer du jour. The rules are available for all of us to read, and I don't see anything in the current rules that distinguishes the radios on this list from all the other amateur radios which are capable of operating on CB frequencies. Why aren't they on the list?

Be sure to let us know the results of you phone call.

Roger

First off, CD, it's grey, not gray... some idiot here in the US misspelled it once, and it's stuck... still wrong to this day... We speak English in this country... so ask the English how they spell the colour grey...

Secondly, you REALLY need to reach down between your legs with both hands, grab ahold of your shoulders, pull REALLY hard, and get your head out of your ass.

Just my two cents.

I don't really see how that impacts the performance. The capacitor that is
being used is a ceramic and has very little loss...

By the way... there is absolutely nothing wrong with using the cap to get
the proper match.

Third edition of what book? Look in it and see if was published in 2000. The questions changed this year, but they are so generic that if you are familiar with the material it would be hard to screw up. Check arrl.org and qrz.com for on line test practice.

I have the same problem with a 1989 Sable, ford has a kit that you can
get form them that installs on the fuel pump, means dropping the tank as
far as I know, closest you can get to the pump is behind the panel
drivers side trunk you will find a relay that shuts the fuel pump off in
an accident, I put 3 caps there, one across and tried it then ended up
with one from each to ground, helped a little, it was noticeable but
still hear the pump.

Cheers

Len

1.)Ford has a kit to surpress noise. Ask the service department about this, it should listed for public service (police) radios.
2.)Next, 3 .01mfd capacitors. One between the hot and ground wire. One from each wire to the shortest path you can to the body.
3.)Bond to the body the battery or check the original, the alternator, at least 2 places on the exhaust pipe, and the hood to the body. Doors, trunk, etc. as you feel necessary.
4.)Wire the radio (hot and ground) directly to the battery with both hot and ground fused at the battery. Shielded cable is better, shield bonded to the body at 1 end (ONLY), preferably at the battery end.

> Would the authorities come down on harder be cause your a Ham and Ham
> should know better, or a CBer for that matter?

....assuming equal enforcement... (you know how it goes... different cop,
different judge, different day can all affect the outcome...)

....I'd say both would be treated the same.... a letter of warning (the pink
slip) first. With continued infractions, further enforcement, possibly a
fine (long shot). Assuming action was taken (another long shot).......
....The CB'r would not loose the Amateur rig (it's not illegal to own it)
nor his license (he doesn't need one)
.... The Ham could loose his license....

.....'Knowing better' has nothing to do with it.... walk into any courtroom
and you'll find that ignorance of the law is not a valid defense......

'but officer..... I didn't know.....'

Funny the cutouts don't show a cap, and right in their literature it states it's gamma matched.

If you take a continuity tester and test across the center lead and the ground on a Wilson coil, you'll get a direct short VERY close to 0 ohms... something like 0.1 ohms on the one I have.. so where's the cap?

-SSB

Forget that book ever existed. Gordon West's books are not real great for learning. Get the ARRL's "Now you're talking" ($15.50 at bn.com) and read the whole thing. It includes the full question pool as well. This book is the easiest way to get into the hobby.

Good luck and 73

No, 28.3 to 28.5 is part of the 10meter band, used for CW and SSB phone, for use by NOVICES and TECHS W/ CSCE ele.1. We can argue this all you want, but I got this info straight from the ARRL ("now you're talking" table 1-2). And, no, I didn't flunk my test, I passed it last week.

I wont cry about my loss, I have only keyed a couple of times in the last
couple of years. Each time very unprepared.
And the 2 pill he mentioned does the watts mentioned on a 1000 watt slug,
It does about 1900 on a 2500 watt slug on a 43p.
It doesn't hurt you guys reputation when someone bad mouths your amps, the
name has become a standard. Take it easy.

<< It was your idea to post bullshit from eBay as if it were the FCC gospel, so why should we do your homework for you? If this is the FCC position, why can't you find it posted on their website? There's no reason for each of us to make a phone call to have the rules interpreted by the enforcer du jour. The rules are available for all of us to read, and I don't see anything in the current rules that distinguishes the radios on this list from all the other amateur radios which are capable of operating on CB frequencies. Why aren't they on the list?>>

Be sure to let us know the results of you phone call.

Roger >>

Roger. The document goes into great detail about the distinction between a CB radio, an amateur radio, and a dual-purpose CB radio. (i.e., banned 10-meter radio). You obviously don't read thoroughly - or you see only what you want to see.

Let's get this straight. You think:

*the document is phoney because it's now posted on eBay.
*that I am lying to you, and the FCC really does NOT care who transmits on what frequency.
*that I am lying to you, and the FCC is NOT trying to stop the sale of so-called 10-meter radios.
*that Mr. Hollingworth is somehow a temporary phenomenon.

No, I'm not going to do your research for you.
If seeing it in black and white isn't enough for you, then you have a perception problem I cannot solve.

So just go on believing in your little fantasy.

Which are produced in the factory and are installed the same, regardless
of what dealership you buy your vehicle from.

Obviously not all self-professed experts tweak and peak radios the same.
The car analogy is apples to oranges.

Source record: 47271

Hi everyone - I've been following along for a few weeks to try to get up to speed. Here's what I THINK is my problem:

I just bought a Cobra wx 18 st 4 watt. I've got a little Toyota, and don't want to mount anything other than a small whip that goes through the glass, like most cell phone antennae. Sorry, I can't remember the brand. I've been noticing what I think is range problems, so I just bought an SWR meter from Radio Shack, and checked my reading.

I'm way over 3. Problem is - I don't really have a way to adjust the length of the whip, do I? It screws on the mount. I didn't want to start cutting until I knew that would help.

I know I have far from the ideal setup, but all I really want is to be able to keep up with the traffic situations ahead. Replacing the antenna is an option, but that's about it, I think, in the way of equipment. I'd rather stay away from the magnetics, even. Adding links in my chain is another thing I'd consider, if you have suggestions along those lines.

If anyone has a suggestion that they think might help, I'd really appreciate it. One question - does the extra foot of coax I put in to connect the meter affect the reading significantly? Seems like it could.
Thanks a lot, gang. Email me, or I'll check in later, if you have any responses. See you on the road!
-=Damien

Around here we have Baltimorons. Unfortunately, no group or area has
a monopoly on morons. If there was, there would be an effort to relocate
them to other areas, so others could enjoy them as well.

I actually paraphrased an idea brought up to the MD DNR about black bears.
Since they refuse to allow hunting, one of the hunting groups has brought
a petition up to allow transporting and "sharing the wildlife" with other
parts of the state. Black Bear Stew, anyone?

You just wasted your antenna fund. You will NOT ever get out far
with a thru-glass antenna. Fact of 27 MHz life. Your signal is
about 36 feet long. In a nutshell, half of your signal is
transmitted by the antenna, the other half is reflected off the car.

From: Daniel Friedrichs <dan@willinet.net>
Message-ID: <398F1EB6.75297D4A@willinet.net>
Source record: 47281

Well, sorta right. On 10 meters (28mhz-29.7mhz), Extras, Advanced, and Generals can use CW, phone, image, ssb phone, RTTY, and data. Now, on a portion of that (28.1-28.5) novices and tech plus's can use cw, rtty, data, and SSB phone.
But as you will notice, no "plain" techs can operate on 10meters. It's everything above 30mhz ("vhf"). That would include 6,2,1.25,70,33,23,13, a bunch of stuff up in the gigahert range, and then everything that's above 300ghz.

"E. Damien Raba",
What you have now is probably as good as it will ever be. The 'thru-glass' antennas are notorious for being a 'bad' idea on 11 meters.
You basically have two options, replace the antenna, or use a 'tuner' inline to get a better match (lower SWR).
As far as the coax jumper you used to put the SWR meter inline, unless the coax is 'bad' to start with, it will make no difference at all.
'Doc

Damn. I didn't spend that much on the glass antenna, so I don't feel bad about the money, but was shooting for a muted cosmetic.

I have a magnetic. Sounds like I'll have to try and get along with it, if I really want performance. I'm going to road test it now - maybe I'll be so blown away, I'll HAVE to go with it!!!

Thanks for the replies, guys. Very cool. I'll let everyone know how things turn out.

Well...

The magnetic scored a 1.3 on the SWR, and increased my performance dramatically. The only thing is, now I'm getting a loud noise that I can only assume is the fuel pump coming through. I'm going to try and searchh back to see what everyonoe's been saying about the filters. Thanks everyone for the help! I'll see you on the road.

I think you're thinking of the K40.... which shows resistance greater than 1 ohm on the continuity tester....

Explain the near 0 ohms resistance on the Wilson, if it's "shunt fed" I've never heard this term before, and I'm wondering what it means.

Your still SO full of shit about that.

Galaxy does NOT have "authorized warantee centers".

If your Galaxy breaks, send it to them.

If you want to modify it, go ahead.

As long as your modifications don't HURT the radio, Galaxy warantees
everything.

Looking to sell a Galaxy DX 2527 All Mode 10 Meter Base Station radio. Unit features all mode AM-FM-USB-LSB operation, 10 channel programmable scanning capabability of any frequencies from within the 26 mhz thru 29.7 mhz coverage. Split transmit and receive for repeater operation, built in talk back, echo & robot voice sound effects. Large well lit meters with red needles and 4 stage adjustable brightness control. Except for channel conversion radio is stock putting out 10 watts AM & FM, 25 watts or more SSB. Variable power knob. Front fire speaker for outstanding sound. This unit is a 25 watt version of the Saturn Turbo with same exact look and specifications except power output. Radio is as new and very low useage, and is in immaculate condition, period. Manual and original box included. I paid $470 for unit new, and will sell for $360 shipped anywhere in United States. Photo available.

819. Re: HELP!!! How do I stop Fuel Pump interference?

Newsgroup: rec.radio.cb
Date: 2000-08-07 00:00:00 UTC
From: -=PEAKABOO=- <tappingdatass@hotmail.comode>
Message-ID: <L7Mj5.1058$KZ6.111556@nnrp2.sbc.net>
Source record: 47360

Fords are notorious for fuel pump noise. the grant style radios seem to filter out the sound a little better than some of the cheaper radios. First you need to determine if the interference is coming thru the antenna or the power wires. You can do this by removing the antenna, if the "static" goes away then it is a little harder to get rid of and you have to locate the source, in your case it more than likely is the fuel pump. Some already posted a fix for that, you can get .1 or .01 ceramic dipped caps from any electronics dealer including radio shack. The cap has two leads make sure they have a voltage rating high enough for the application, most of these caps have at least a 50v rating. As close to the fuel pump as possible strip the positive and negative wire, you can do this without cutting the wire, now wrap one lead of the cap around the positive wire and the other lead around the negative wire. See if this fixes the problem, if so solder it and tape each wire individually, tape it up good and tight, I don't like electrical tape but the factory uses it and if you don't cut the wires you will never have any problems. If this does not fix the problem try adding another cap parallel to the one already on the wire. Remember the fuel pump sound only last a couple of seconds after you turn the key on and then when you start the motor it will be continuous.
Good Luck
E Mail me if that does not fix your problem

I have a midland 77-805 that is only putting out about 1 watt with backward swing. does anybody know the adjustments for this radio. it has a high low switch and on low its about .5 watt with some forward sting. any help would be appreciated

Not to mention they also tell you, "we don't handle CB issues
anymore" right over the phone. I've heard this comment from more
than one person that has called the FCC on issues of jammers, and so
forth. It may not be the "official" stance of the FCC, but if the
office personnel don't give a flying fuck about it, do you really
think the rest of them care? The FCC only has shut stations down
in cases of severe interference, or "wandering shit disturber" hams,
who jam other stuff as well as the CB. The FCC just uses the
"counts" of the abuse on CB against them in court as a means of
making more money, etc. This is what those fancy, pompous ass type
bulletins from the ARRL never tell you- they never tell you that the
"cb offender" that was arrested was also jamming other services
as well, or causing massive interference in his area.

822. Galaxy DX66 and Antenna Problem

Newsgroup: rec.radio.cb
Date: 2000-08-08 00:00:00 UTC
From: WI5O <WI5O@bigchihuahua.com>
Message-ID: <uzABLYUAAHA.264@cpmsnbbsa09>
Source record: 47299

A friend stopped by for help with a Galaxy DX66 and a new antenna to install.
The antenna is a Radiall/Larsen NMO/Motorola 3/4" mount with a coil for 27-31 megahertz and it is mounted on the roof of the vehicle. We have tried a few different swr/watt meters, checked the coax and other connections and even trimmed down a blank whip a few inches and the swr is very high on all of the cb frequencies from 1-40. We've taken the radio and attached it to a tuner attached to a vertical antenna and it tunes just fine, so we know the radio works fine. However, we have checked the antenna, mount and coax and it checks out just fine.

Do any of you have any suggestions that we might try to isolate the problem and get this person's radio and antenna working??? By the way, the radio is also grounded well.

>back on the car 2 days later!!!

None if this applies after the K40 BLOWS UP by applying more than 50
watts or so to the thing. I've seen them get destroyed by a small 2
pill and a little bit of condensation.

After running both I will never go back to a K40, ever... too
expensive for an antenna that explodes and a mount that is
mechanically unstable and loosens over time. I have yet
to find anything that can beat the wilson at it's length
class. The only antennas I can think of that would maul a wilson
are a stargun bopper, a goldenrod 45, and a 102" whip. (there are
probably other large coil antennas like the bopper that would kill it
too.)

The "velocity factor" would all depend on what you used for a reference.
You could use distilled 100% pure water as a reference, and then take the
impurities found in a lake to calculate velocity factor.

Source record: 47307

Thanks for the compliment. In the case of mobiles, the vehicle itself is part of the antenna system. So you would be tuning the radio to the antenna system (the radiating element "antenna" and the ground plane "vehicle").

Yes, moving the antenna, coax, and radio to different vehicles will usually change the SWR because the ground plane is changing, which will in turn change the antenna impedance. But the whole idea is to get all impedances (radio,coax,antenna system) to match, in most cases they should all be 50 ohms or somewhat close. Equal impedances will result in maximum power transfer, and reduced SWR. An antenna tuner is used sometimes to adjust the impedance between the radio and coax to achieve a 50 ohm match between radio and coax, but between coax and antenna system, there will still be a mismatch, and this will result in power lost due to reflected waves.

But for most people new to radio, the analogy of a rock thrown into a lake is one that they can readily understand, and the physics involved are pretty much the same.

Cross-posted to: alt.radio.cb.skip,rec.radio.cb

Have one messenger M650FR amp;

1 driving 8 SD1446s, does about 700W PEP tops with good
alt or stiff supply. This unit is designed to be full remote, and as

such has a remote control head unit as part of its design. Class
AB1, clean as a whistle on SSB. Excellent condition, includes
ferrite on power leads and on remote head. Has 120MM ball bearing
fan mounted to heatsink. (externally powered..) keeps this bad boy
cold under duress.

Asking $500 or best offer.

-Mike

One of the BEST C.B. antennas I ever owned was a 5/8 wave ground plane that was called "The Star Duster". It wasn't like other ground planes since the radials didn't come out at a 90 degree angle to the main element...but maybe closer to a 150 degree angle. Another manufacturer made a similar antenna called a "Golden Hawk"...I think.

Are these vertical antennas made any longer? If not, does anyone make anything similar to these antennas???

73's,

Gene

<< Not to mention they also tell you, "we don't handle CB issues anymore" right over the phone. I've heard this comment from more than one person that has called the FCC on issues of jammers, and so forth. It may not be the "official" stance of the FCC, but if the office personnel don't give a flying fuck about it, do you really think the rest of them care? The FCC only has shut stations down in cases of severe interference, or "wandering shit disturber" hams, who jam other stuff as well as the CB. The FCC just uses the "counts" of the abuse on CB against them in court as a means of making more money, etc. This is what those fancy, pompous ass type bulletins from the ARRL never tell you- they never tell you that the "cb offender" that was arrested was also jamming other services as well, or causing massive interference in his area.

-Mike >>

Don't like the arrl, do ya mike? That's good, cuz they prolly don't like you either.

So watcher sayin' above heah is that the ole FCC dont give a hoot about CB, is that about the gist of it?

Still don't explain that "illegal transciever list" and why the lethargic, unresponsive FCC bothered to post the names of two agents, their email addresses, and even their phone numbers.

<< If so I am in the market for a Globe King 500B. Wher can I find one?

<>

"A good talker"! LOL!

The Globe King 500B is a 500 watt AM/CW ham transmitter in a 4 foot steel rack made in 1958 that weighs close to 300 lbs!

No "cb receiver" comes with it.

And its high level plate modulation circuit is designed to sound good at only 100 % modulation.

You don't want such clean audio quality. You want big, loud, distorted and splattery-sounding audio, with all kindsa echo and roger beeps, remember?

Stick with yore modded Unidens and Cobras!

gilles,
Guess it just depends on what your after, quality or loudness.
FM deviation is not adjustable by 'ear', if your looking for a
clean, undistorted signal.

Over deviation is a problem with these radios, or on some. I have two different brands of FRS radios and a modified Alinco ham radio that can transmit on FRS freqs. Brand one will work when I talk far away from the mic on the Alinco which is, at beast, impractical. If it deviates over the standard FRS (which for ham stuff is 5KHz I think, and FRS is 2.5?), brand one will clip and not get all the message through. Brand two works perfectly with the Alinco as well as brand one since they are both FRS but it depends on the radio's ability to recieve wider signals as these ham transcievers are.

It really doesn't matter as long as they are operating according to limits of their license. A Tech + can use any voice mode in the portion of the band where they are allowed voice privileges.

How long is your ground wire? Make it as short as you can, once you've done that you can go an get a real antenna from somewhere OTHER than Radio Crack.

Well, standard response here but most of these radios are surface mount (some of the FRS newsgroupies think that is a major problem for some people which, if you are good with a soldering iron, is not.) component filled and *I think* most are controlled with a programmed IC for all of the frequencies. Knowing cherokee's history with modifiable radios, I would say this looks like something promising. But I really can't wait for all the guys over in alt.radio.family to start bitching about people asking for mods on THIS group. While they have good reason to, it gets old after a while.

Source record: 47340

Selling an Eagle Sidewinder 400 10 meter radio with RF Limited Power microphone. Radio is all mode AM-FM-USB-LSB with 400 channels covering 25.165 mhz thru 29.655 mhz. Never mounted in a vehicle. Works and looks as new, except for burnt out display light, (easy fix) but large display is still very readable. Very loud very clean modulation from this radio. Sell radio and matching power mic for $100. Sell Radio alone for $75.

864. need base antenna help

Newsgroup: rec.radio.cb
Date: 2000-08-08 00:00:00 UTC
From: Robert Griffin <Rob41@tir.com>
Message-ID: <RT3k5.20036$gv3.615044@news-east.usenetserver.com>
Source record: 47341

Hi all, need a hand please. I have ran mobile CB's for a little while and have decided to go for a base station just to talk local to a few friends. Radio is a Uniden PC66.
Here is what I did to try and make a base antenna. I have a 1/4 wave whip that I used as a mobile. I bolted this onto a water pump that I have in my yard. The water pump is the old hand pump metal kind. It isn't hooked up to a well, just buried into the ground for a ways. Anyways....I bolted the whip to this and ran the coax from this to the radio inside. I used the mount the same as I did mobile (which had very good results). Then I tried the new setup. My buddy used the new "base" station and I went out in my mobile. Base station received the mobile perfectly. When the base station would transmit, the mobile station radio needle was pinned, however I couldn't hear anything. I could tell everytime he transmitted, just couldn't hear any words. I know the radio works well as it is a great mobile.
Anyways, that is the problem. Like I said, I just need the station to chat local, only about 2-3 miles so anything you suggest would be great. Also, I don't really have any extra money right now to buy a dedicated base antenna, so any way you could help me with the equip. I have would be really great.

Thank you for your time.

Does he still have the larsen cutting chart that came with the antenna?
How long is the whip?
There is a tab in the bottom of the coil (base), make sure that it contacts the center of the roof mount. Bend it down slightly.....

Looks the same to me....heard a bunch of them talk way back when and they seemed to work. They look like a 1/4 wave ground plane to me the way that they are designed. I cut up a few of them to make yagi elements recently.

I can't imagine being blown away by the performance of any cb, but if your goal in life is to have a short antenna, perhaps you should look at getting an amateur license so you can operate 70 centimeters instead of 11 meters. Much shorter antenna!

First off, CD, it's grey, not gray... some idiot here in the US misspelled
it once, and it's stuck... still wrong to this day... We speak English in
this country... so ask the English how they spell the colour grey...

Secondly, you REALLY need to reach down between your legs with both hands,
grab ahold of your shoulders, pull REALLY hard, and get your head out of
your ass.

Just my two cents.

OK, here it is, directly from the ARRL website concerning the Technician Class license.
"Technician Class operators are authorized to use all amateur VHF and UHF frequencies (all
frequencies above 50 MHz). Technicians who pass a 5 WPM Morse code examination are entitled to
limited power outputs on certain HF frequencies. "Technicians with HF" may operate on the 80, 40,
and 15 meter bands using CW, and on the 10 meter band using CW, voice, and digital modes."

So to make the blanket statement that Techs have 10 meter privileges is not entirely true, you must distinguish between No-Code Techs which do not have 10 meter privileges and Coded Techs who do.

Its such a shame that these crashes happen. People that find plane crashes
amusing should think what it would be feel like if it was their family that
was a victim, I am sure the laughing would stop. So think about it.

hello just to inform you that in cobra frs250 you can adjust the
modulation level
to increase talk power. adjust the DEV pot fully clockwise.

also in the SYLVANIA fr200, you can adjust also the squelch SQ
and the modulation labeled MOD

These are surface mount pot so be carefull.
waving the hand....

901. Re: modification on frs radio...

FM works alittle different from AM... if you increase the dev
control to much the recievers will clip your signal....sometimes
more is not better.

Anywhere they are allowed voice privileges they can use AM, FM, or SSB. AM and FM are not limited in use to above 29 MHz. By the way SSB is an AM signal.

Cross-posted to: alt.ham-radio.dxing,alt.ham-radio.mods,rec.radio.amateur.dx,rec.radio.amateur.misc,rec.radio.cb

DXbase 2001 has rotor control plus everything else under the sun in an intuitive easy to operate interface. The database itself uses the Microsoft Access database format and as such is extremely robust and rugged. One can also have internet and VHF DX clusters both going at the same time. It also prints custom qsl cards. It is compatible with and supports all the CD Rom callsign lookup CD's. This is a case of there being " too many features to mention " I have used it since DXbase 2000 without ever having one single program crash ever. It is a reliable workhorse that is capable to meet the needs of the serious DX'r and is also just as home logging a rag-chew QSO with an old friend.

It does require a Pentium so it is not for everyone I suppose. I have a link to the demo on my site on the Software Downloads page.

>either.

No, I don't. Amateur radio could probably do without them. They
censor article contributions, and snuff expert columnists.... all
because of corporate greed via their advertisers. They poison the
minds of new operators via their media propoganda. 70% of all hams
are breathing ARRL fumes, and it shows. The only things they ever
did to help ham radio was VEC operated exams and introducing Tech no
code.

>So watcher sayin' above heah is that the ole FCC dont give a hoot about CB, is
>that about the gist of it?

Exactly. They don't enforce the CB unless someone is creating
tremendous problems with a CB transciever (legal or illegal, does not
matter, they don't care) They don't have the manpower and funding,
to waste their time on a band that they lost control of many years
ago. They have bigger things to worry about, like retards jamming or
interfering with public safety frequencies and repeaters.

>
>Still don't explain that "illegal transciever list" and why the lethargic,
>unresponsive FCC bothered to post the names of two agents, their email
>addresses, and even their phone numbers.

I can explain it, rather simply. The list is a means of ass covering for FCC employees, to make it look like they're doing their job or something. They're hoping (a really bad longshot) that by banning these radios, that it will substitute real enforcement. They stomp their feet and pound their chests to make it look like they're doing something, so someone doesnt get the idea of shitcanning the FCC. (many politicians have mused about this at one time or another- I feel eventually the FCC will at the very least get segmented, if not destroyed and 2 or 3 other organizations will rise to take its place- it's scope is far too wide)

The FCC got bitch slapped by ranger and CTE over this import/export crud.(They brought them to court and didn't win... I can still buy ranger stuff and CTE antennas and other stuff they make, so apparently the entire case was close to meaningless, in real terms.) Even if the FCC was capable of shutting them down, then the "internal black market" turns on. (people smuggling crap in, brewing their own etc....) There is no stopping the flow of "illegal" transcievers and amplifiers. As long as the demand is there the radios and amps will flow. The only thing the FCC can hope for is that someone invents a replacement for the CB. And even if that happened, you'd probably still end up with a few hundred thousand die hards on the "old" 27 mhz band.

The bottom line is the "war on illegal cb" is just like the "war on drugs". They both have a high probability of never reaching a terminus, or a major defining moment. The only moments would be the USA becoming a totalitarian state or the revocation of the silly laws.

> signal.

Sorry..... try reading the rules instead of quoting hearsay....

AM & FM are off limits to Coded Techs on HF freq's... if you'll read the rules (part 97.307-f10 you'll see what I mean. I DID not state that AM & FM were limited to freq's above 29 Mhz..... I said you'd find them there (due to band-planning). Those modes ARE available to higher class licensees on any freq 28.3-29.7Mc but NOT to Tech +'s. Novices and Techs with code may operate 10 meters via 3 modes ONLY as per the rules..... CW, J3E (SSB) & R3E (Digital... RTTY, AMTOR, Baudot, or ASCII). Max power output for Novices and Techs with code on 10m and all other HF bands is limited to 200W (part 97.313-c2).

Opinions and/or your experience. Are these radios everything that ExportRadios (Express Electronics) claim they are? On their web site they say the new ranger 2950 and 2970 are the best mobile radios they have ever seen. Marketing hype or fact? I dont mind spending more if I get the extra value in a superior quaility product. Are their better mobile radios that cover the cb channels than these? Let me know your thinking on this. TIA Nick

You where doing great until the last few sentances where you opened your big friggen mouth and inserted foot. Listen numb nutz, some of the best AM broadcasters are on 11 meters whether you like to believe it or not. Do you think running Yaesu, Collins, Drake, E.F. Johnson's are being used just on the Hams bands? The best AM stations in the World are on 11 meters. You better get a reality check busta.

One thing I must mention, 11 meter operators don't so much hoard there equipment and put it on a shelf as a show piece or idol. They key that thang down like it was meant to be used and operated. 24-7 you can spin that VFO and hear them 11 meters stations going at it while the other bands are dead. Now you want to tell me about what a real radio is all about, please go get a late pass.

Same as on the 148/148F/2000/GrantXL.

I've got a GrantXL and a 148 that slide 6Kc each way, centered knob, and
a fine tuner as well that goes 200c each way, on a mod to the mod that
I've cooked up. Email me directly for schematics/destructions.

Problem's not the antenna... If it's pegging the needle, it's putting out... so, either the mic gain was turned all the way down, or your friend wasn't pushing the key all the way, or there's something wrong with the radio.

Just by two cents

your grounding system (what the antenna is hooked too) is half
the antenna..... sounds like you missing half your antenna.
it needs a large metal mass, like a vehicle. try running a 10
ft. large guage wire from the antenna mount to the ground and
burying it. then cut one inch at a time off the wire to
adjust the swr... its called a floating ground .

Hi

I would advise you to trade the 2970 for
an amp ready to go. I have several
of each but don't want to get rid of them so
I'm not making an offer.

Surely someone would trade you for the dead
2970 for an amp. And you wouldn't need to
get into the hassle fixin' up the 2970 amp.

IMO... I think it would be a good
deal for I can usually get 'em (2970's) going again.

Still.... The schematic for the 2970 and the amp are
an integral part of the QuicFix CB repair programs.
See our site at: www.efjdevices.com

Now Dave did you really read the post?

THe meter is pinned. Tht's all the way to the right.
Hardly a result of 1/2 of an antenna.

Problem is related to audio, blocking, no TX audio, a joke on the part of
his friend (not talking).

The group has helped me before and I hope you guys can help me now..

X-Force XT400..(2) driving (4) amp..In my co-workers truck when he keys it shuts the truck off..The amp has a good frame ground..
My friend is using a President George for a radio, and a Skip Shooter 5' antenna..I put his amp in my truck and it works fine with my Connex radio..Put his amp back in his truck and used my Connex as the keying radio..I can deadkey and truck will not shut off..But as soon as I say Audio, the truck misses, but does not die..Is this a ground problem??Weak batteries or alternator??Both trucks are the same except mine is one year newer..Any help wold be greatly appreciated...

channels
> than these? Let me know your thinking on this. TIA Nick
>

The RCI is my favorite radio. I've had the president lincoln and is
also a very good radio with about the same features as the 2950 and
from my experience with several types of export radios from galaxy
33,44,55,and 88 along with connex and a couple of superstar radios the
RCI and President radios are the best.

Also the RCI and President are the most stable on SSB out of all the
other export radios I've tried. Freq doesn't drift.

but as many will tell you it's all a matter of opinion and the best
radio for you all depends on what you want in a radio but I'd believe
export radios on this one out of my experieces...

enjoy.

Hey baby, I'z just tellin it like it is. And what's "get a late pass"? Izzat supposed to be a put down? LOL!

<< You where doing great until the last few sentances where you opened your big friggen mouth and inserted foot. Listen numb nutz, some of the best AM broadcasters are on 11 meters whether you like to believe it or not. Do you think running Yaesu, Collins, Drake, E.F. Johnson's are being used just on the Hams bands? The best AM stations in the World are on 11 meters. You better get a reality check busta.

One thing I must mention, 11 meter operators don't so much hoard there equipment and put it on a shelf as a show piece or idol. They key that thang down like it was meant to be used and operated. 24-7 you can spin that VFO and hear them 11 meters stations going at it while the other bands are dead. Now you want to tell me about what a real radio is all about, please go get a late pass.

KRS

It's a computer problem. Some say that they have had good luck in cutting the stray RF to the computer. I busted my ass for a year trying; I finally gave up and went to a small 2 pill.

Actually thats not true...Things like pin stripping,Scotch Guarding,gold plating,etc are all done strictly at a dealer level (I know.This is what I do).Its how they actually make their money...To put a pin stripe on a car takes me like 20 minutes and costs like $3 materials but if you look on the window sticker under dealer installed options you`ll see "Color coded accenting stripe" $125!.Scotch Guardings the same.A can cost like $5 and takes like 5 minutes to apply but they`ll charge you over $100

I had a similar problem....

Solved it by building a dipole... I could run all the power I wanted and had no problems with the truck shutting off. This was in a '98 KW T-600 with a 3406E @ 475.

Hope this helps.

Robert,
I wonder how close you were when you got the 'pegged' meter? I
doubt if it's the antenna, you might check the operation of the radio.
The 'pump' antenna may be working fine, depending on the well casing,
but if your not hearing any audio on the signal, and if your not too
close, the problem is more than likely the radio.

And, since the FRS channels are interspaced with the GMRS
channels,
you might be too close to their channels, and interfereing. Since
the GMRS license is $80.00, someone is going to get a bit 'T'ed off
and
report you. Leave it alone, your just asking for it...

carefull.".....
Increasing the deviation of an FRS (or any FM) radio Does NOT increas its
"talk Power" or range in any way. It may make other FRS radios receive clip &
distort when receiving the "too wide" deviation" modded radio. The output
power of an FM signal remains constant (500Mw) regardless of weather or not
there is any audio, a dead carrier, or any level of deviation, unlike AM which
has wattage "swing" when audio is applied. Don't mess with your FRS
deviation, at best there will be no difference, but you may screw up that
radios ability to be heard by other FRS rigs........

Is the amp deadkeying extremely high? It could be oscillation. What is the SWR? If they are high it could cause this amp to start to oscillate. Try changing antennas and see if it helps. I have seen a lot of 2x4 amplifiers that go into oscillation real easy.

Not true... increasing the deviation will increase your "talk power"! The only downside is that by doing this you will take up more channel space by deviating more. You will have a tendancy to bleed more to adjacent channels. This never bothered me much... lol

Message-ID: <3991D50F.65B057FA@vlsi.polymtl.ca>
Source record: 47477

hello;
I have got 2 hr2510 and 2 ranger rci2950,
for the quality you chose the hr2510, good pots quality pcb and reliability
therefore you chose the rci2950 for the freq range and others options
and for the evil modulation on AM and all the easy mods to be done in rci radio

on my side I now own 2 rci2950 and don't want other radio.
to get mod on your ranger you can go on the rciweb website

ok waving the hand

Source record: 47478

This is not unusual at all. What is happening is that RF is entering the computer system and disrupting the microcontroller. The first thing to check is to see the that the computer metal chassis is well grounded. This should take the form of a short piece of braid attached to the computer chassis directly attached to the chassis of the vehicle. If this has already been done I would attempt to put an RF choke in the B+ lead to the computer as close to the computer chassis as possible. These are two fairly easy things to try and keep RF from entering the computer...

My name is David from Express Electronics Incorporated. I am the sales manager of the largest export radio site in the world.

www.exportradios.com

We are the largest RCI dealer in the country. RCI (Ranger Communications Incorporated) manufactures many of the top name radios on the market. A few of the radios they manufacture are Galaxy, Connex, Super Star, Texas Ranger, Ranger, and of course RCI. We sell and repair all of these radios along with many other top names like Cherokee, Uniden, Midland, Cobra, President, Magnum etc. We keep our prices below all of our competition. We can do this because we sell more radios than our competition.

The reason I am posting a message here is because we offer tech support via e-mail. If you have any questions about the specs of a radio, how to operate a radio, what the best radios are, or anything else to do with CB's or exports, you can e-mail us and we will try to answer your question.

My e-mail address is

sales@exportradios.com

You can e-mail me and if I can't answer your question, I'll forward you to our tech department. Also, be sure to check out our website. We have a lot of information there that just may answer your questions. As always, we look forward to helping you with your radio needs.

And that is all the FRS band needs is modifying radios so the FRS band can be polluted with over modulated splattering radios so it can sound like 27 MHz.

I have used President radio's for years, (Jackson, lincoln etc.). And for good long distance dx&#65533;ng there is nothing better. A lot of my friends use rci's but they couldn't hear stations calling that i did hear under identicall surcomstances. Get a Lincoln have it modified from 26/30 mhz, turn up the power to 35 watt's and use a Kenwood mc-80 mic. and you'll have the best radio money can buy in that price catagory. I live in The Netherlands and have used President's for 11 years and besides my hf radio's nothing comes close. I've got qsl cards from all over the world. In some cases i have even reached New york on fm mode using only 40 watt power on a vertical antenna.
Whatever you decide my nr 1 is President/uniden.

Good luck with your decision.

Message-ID: <3991ECCD.A51BD025@willinet.net>
Source record: 47486

I agree with the person who said modifying is against regulations. Why would you even want to modify a radio? There's a radio service for just about every communication need, and if you need high power over long distances, FRS isn't it!
You talk of "having a brain" - you're wrong there. People with brains know how to write in complete sentences, use the correct tense, use proper grammer, and use the shift key!
What is there to learn from modifying a radio? You'd learn how to modify a radio, of course! But what use is that? It's illegal to do most modifications, so why even bother learning how?
Some of you that think the world wouldn't spin if there weren't 11meter amps need to stop trying to be such idiots. If you want more power with more distance, go to a different service (amateur, for example)! CB is not a "long-distance" idea, it's for simple communication between users. Or, it was, before all you idiots started using amps and mods.

Stock radios already do 100% modulation but what you want is to have more Swing. turn you power down to about 2.5 to 3 watts and let it swing up to the peak.. it will allow you further distance and longer life out of your finals.

You'd do better turning the carrier down to between 2 and 3 watts, getting a good tune on the transmitter and synthesizer, and letting the radio swing to what it will do...

Anything over 100% modulation translates to distortion and bleedover. Swing is the thing that makes a radio zing... it'll last longer, too.

Message-ID: <8mt49ohfc1@slb0.atl.mindspring.net>
Source record: 47494

You guys all helped me so much with my last newbie question, I figured I'd venture another...

I'm getting a 1.3 SWR on a magnetic Radio Shack antenna. Is there any reason to change antennas at this point? I may buy a modulator, but except for that, my system is probably going to stay the way it is.

Is the lowering of SWR from 1.3 to 1.1 REALLY that important, or are we talking about minor changes in efficiency here?

Again, thanks a lot for all your help with the last question. You guys blew me away with the responses. Very cool.

See you on the road. - Damien

The difference between 1.3 and 1.1 would generally be considered trivial.
1.1, of course, is theoretically closer to perfect, but it is also in
reality more unlikely to achieve.
1.3 is a respectable reading with any antenna. SWR often is higher with
mag-mounts anyuway. If you have a 1.3 reading with a mag-mount, you are
doing very well.
You should also note that your reading will be slightly different on
different channels. Check SWR on all channels that you use, if they are
all this close, I wouldn't worry about it.

What does the other language have to do with anything???
I disagree with the frustrated, unscientific mind, though. For example, today I spent $35 to build an antenna that I could buy for $10 just to know how to do it.

My intention with the post was to explain that it's alright to experiment, but not to use it if it's illegal. Those rules are for a reason.

Damien,
With a 1.3:1 SWR, I'd leave the thing alone. There is no
practical
difference between a 1.3:1 and a 1.0:1 SWR.

After my last post, and the quick responses (Thanks everyone), I went out to recheck the SWR on Channel 1 and 40. When I originally did the check, I only tested Channel 19, figuring it was in the middle, and I'd be using it most, anyway. At that time, I double checked the Calibration, and SWR, and came out with 1.3:1. Tonight.. Different story...

I'm way over 2:1!!!! What happened? I did notice that, depending on where the meter was, how the coax was adjusted, and even where the mike lay, dramatically affected the reading. How am I supposed to tweak my system, if I can't get accurate readings every time?

I ended up just leaving the thing the way it was, and hoping that my lowest readings would hold in a driving situation. I figured there wasn't much difference between a 1.3, and 1.1:1, but I'm not comfortable with anything over 2:1. Sheesh...

As always, thanks everyone for the help. Hope everybody has a safe drive - see you on the road!!! -Damien

Have noted over the years that mag mounts and SWR with same can be influenced by something as simple as a little bit of humidity. Lift the base, and give the car a quick wipe down should there be any condensation buildup from the evening dew.....check SWR again, as well as the coax connections and the coil/base connection...make sure it is all clean and dry, with good continuity where it needs to be (and none where it shouldn't be!) There are those, myself included, that think 2:1 isn't critical, but it certainly isn't optimum. Performance differences will be negligible, but still could be better.....

RCI's are very user friendly, lots of nice features, but IMHO are not as well constructed as some of the others. Personal preference for a straightforward radio is an early (1201 PLL) 2510 and a good mike. 2950's etc.are good running, good sounding rigs that can be had used for a good price with a little careful shopping (generally NOT on the Web) locally at hamfests,and from CBers who are swapping around.

Well, there is a lot of information out there. Check out
www.angelfire.com/electronic/cbdoctor/home.html. There is some good
advice there. For instance, a 'perfect' quarter wave whip over a
perfect ground has an impedance (when exactly tuned) of around 32
ohms. This means 'perfect' will have an SWR of over 1.5! The SWR per
se is not important. It can help you tune the antenna, but unless the
impedance of the antenna matches the coax, you will not have a perfect
1 to 1 swr. This is NOT important. It very slightly increases coax
loss which for good coax and reasonable lengths will not be significant.

Talk about not knowing how a radio works.

sideband wrote:

> amplifies that, and transmits it.

Audio is not applied to the synthesizer. In an AM transmitter the audio is applied to the final rf amplifier stage. And carrier is not mixed with modulated audio. It is mixed with the audio and that produces a modulated carrier. In an SSB transmitter the audio is applied to the balanced modulator.

>

Again, this audio is not applied to the synthesizer.

>

> close to 100% as possible. This causes more swing... Swing can be equated to
> the resolution of your computer monitor. The higher the resolution, the more
> data you can fit into a fixed space. More swing makes CLEANER audio at the same
> modulation percentage.

The process of modulating the carrier produces the swing, the higher the percentage of modulation the higher the swing. To much modulation and you exceed 100% producing distortion and broad band splatter. The amount of swing is directly related to the percentage of modulation. The percentage of modulation varies widely and will hit 100% only occasionally on peaks.

>
>
> Yes, overmodulating a radio will make it swing harder, and waste RF energy on

> 100% as possible will make the radio swing as well, and, as I said before,

> swing is the thing that makes your radio zing.
>
>

You don't set the modulation to 100%, as stated above when a carrier is modulated the modulation percentage varies over a wide range and will hit 100% occasionally on voice peaks. It does not stay at 100%. In your first paragraph where you state, "I must admit, I've got only slightly more than a basic understanding of it myself." I don't think you have even a basic understanding.

Reducing the carrier so that it swings with modulation is no better that having full carrier that is properly modulated. All it does is make output and s-meters swing which make some think they are getting a better signal.

I am a retired radar engineer who just got back into CB through our neighborhood watch program. The last time I owned one was 1974. I keep hearing about swing and swing mods. The best I can figure is that "swing" is what we used to call "forward modulation". We used to get this with "power mikes" and modifying the modulator section for more gain. I am guessing but the way I figure it the trick is now to reduce the RF instead of increasing the audio to increase % of mod or is this like "super modulation" where you clip the negative audio peaks to keep the RF amp from distorting by being driven into cutoff and run about 110% on the positive peaks? Am I on the right track?

According to the proof above provided by Deja.com John (call me toilet-boy or Corky) Mackey is more than a liar. He strikes me as very very sick. These are just 15 of the different names he has used in the past few months. Thousands of messages but all are calling people liars or trying to convince us John (call me toilet-boy or Corky) Mackey is better than a dead man.

I am going to forward this to abuse@home.net his ISP. Maybe they can help stop the one called John (call me toilet-boy or Corky) Mackey from further destroying this and the Ham Radio hobby. Maybe we can all write the ARRL about this great fool of a Ham they have representing the hobby.

Tim Larson think I'll stick with CB!

Computers are so kewl, John Mackey told us he doesn't lie. John Mackey told us he doesn't change his name to advoid kill filters. John Mackey told us he was cleaning th group up. Computer are kewl! You can search things and find the truth. John Mackey hasn't been telling the truth. John Mackey comes off to myself and it seems over 45 users as a liar. Computers are kewl. Here's what they show me.

From: Toll Free <tollfree@bigradios.com>
Message-ID: <ukBk5.457815$MB.6942318@news6.giganews.com>
Source record: 47540

Uh, no.... Apparently you've equated swing with modulation... they're NOT the
same.

>>>I think that statement sums up your knowlege of how a transmitter works.

>>>Key up a radio, and apply no modulation. See how much swing you have?

>>>Now, give it some audio.

>>>Bet you get a lot more swing with modulation applied than you do with a
dead carrier, huh?

>>>You haven't the foggiest idea of how a radio ACTUALLY works, just what
you heard on channel 19.

>>>>Toll Free

1056. Re: Galaxy DX 959 Frequency Counter Problem

I have.

I actually KNOW the people who ARE Galaxy.

Pick up the telephone. Call their tech support number.

Ask the gentlemen who answers about what you are saying. Then ask him how
he knows Toll Free.

I learned a lot of what I know by the person who is
tech_support@galaxyradios.com

Have a nice day.

When one skirts the issues being raised it means one has no relevant input.

Taken and put into language you will understand (and this is HOPEFULLY understand), you answer none to all of the above.

So, have a nice day.

Asshole.

> Thanks,
> Ken
>
>
Please do not try it. There are really two grounds we use - a safety ground, which is tied to the 110 wiring of the house. This ground must be connected (proper outlets, etc). The other is an RF ground. Usually you will be unable to get a real good RF ground at the radio - simply because if the line from the radio to a good solid ground is only 9 feet long, that represents a quarter wavelength! An RF ground may exist at the antenna (say a vertical - the braid will go to a ground plane to act as an RF ground or ground itself). If the antenna and feedline are properly installed, we won't have any RF to speak of floating around at the operating position. Just remember the important ground is the one for the 110 volts - it is a safety ground - and a gas pipe is hardly a safe safety ground!

Prozac, I guess you know who I was talking about with your one time buy of a 32 pill that Howard built for you! (I saw it when it was being built, just before Horward went down the road) I talked to Dave and asked him who you and the bayshore network was, and I got the answer! nobody's! I'm not trying to make a buck, but I see you were fast to put a price on it, where were you going to get one? trying to sell the one and only box you own? hey buy the way...do you still have the one bird meter you display on your site?(you know you should get into photography, it may be a better hobby for you, I've never heard a camera man call a DUCK) maybe I can sell it for you! and my used stuff is always for sale, and in most cases it is in better shape then the price I ask for it, Call Dave, you should have his number, and ask him who I am and what part do I play in this, but never mind he has caller ID and chances are you won't get through. That is why I don't post much on the board, it draws flies. Hey! but remember, if you need anything call me, just get the number from Dave lol........

>>Dumb quote : " to increase talk power. adjust the DEV pot fully clockwise....."
???????? What can this do?? The only reason I can see to do this would be if 1) The radio was "out of spec" & set way too low or
2) You are trying to match the XMIT to a non FRS radio that uses a wider deviation, like a GMRS or commercial rig, which would allow the audio to sound a Little louder on these radios, but may make you too distorted to be heard on other FRS radios.
What talk "power" does this person mean?? The output power of the radio does not change AT ALL regardless of the deviation settings, & as there is no wattage "swing" on an FM signal there is no "power" , range or other increase by doing this. Doing this certainly can't clear up your too distant weak signal, you need more output for that, but I guess if you don't over do it you may sound a LITTLE different to another FRS radio that was ALREADY recieving you clearly(big deal).

It does bother other users. Modifying radios does not improve sound
quality.....plus

Modifying FRS radios is against FCC regulations and voids type
acceptance to use the radio.

What the heck is a swing mod.>>

Swing has always been the same.All it refers to is the Peak or RMS reading you get when you modulate.For example if you were dead keying 4 watts and then when you spoke/whistle,whatever,it were to go to 15 watts you`d have 11 watts of swing

In the the big picture of a well tuned radio, where does "swing" fit in? In other posts I have read read about having no more than a 4 watt dead key soooo, I am guessing the bigger the swing from your 4 watt dead key the better... is this correct? Nick

Well, I am semi close to Maryland in Virginia (and when my radio was working I could talk up there easy). The WMC club and pretty much everyone else hangs out on 36 LSB. Rockville and surrounding folks talk on 13 occasionally IIRC. Baltimore, well there is possibly different stuff up that way as far as locals for you. Just scan around. If you have the capabilities, 27.485 might have some activity on it (from what I have been told by someone up your way). Try 36 LSB sometimes though. I can get straight night time shots up to PA and Bowie and some guy over near Timonium easy with just a piece of wire I am using for an antenna. Those guys have some great ears. I go by 793 on the radio but if I can get back to you.

1.) I Never said I was going sell anyone my 32pill or my 2 pill, 4 pill,1x4 pill, 2x6 pill, 8 pill, 2x8pill ,16 pill or anything else as you are faulsely accusing me of.

2.) Your right Dave doesnt know who I am. Did I say he did? You were fast to jump and say I dont know what im talking about cause Dave builds the amps but then you just told the world you saw Howard building mine? HMMM?

3.) Why would you call dave to find out who I am? I already have a girlfriend good buddy.

4.) Why should I call ask about you? I know you got more watts then brains I dont need anyone to verify that.

5.) You started this argument not me 10-4?

Yeah yeah, it isn't hard. The Tekk/Bell FRS (older ones) are not hard. You can widen the hole for the antenna and put a BNC (or maybe an SMA) on there and be fine. Or make a stud to your-favorite-antenna-connector adapter and be fine as far as those radios are concerned. You could even use an RCA plug or something similar to do it. And yes John, we all know that this is illegal.....

Sounds like an aluminum 'free-standing' tower. I would agree with
you, that's a bit much (actually a lot 'much'). I'm not to 'high' on
aluminum towers, especially used ones.

Well, what type antenna did you put on? I worked for a 2-way VHF/UFH/trunking/cell phone outfit, and you can buy gain antennas for handhelds. For what it is worth, I have a 440 MHz HT and at about 12 miles from the repeater, I was unreadable on low power, and just a little bacon frying on high. I replaced the rubber duck (around 8 inches tall) with a gain whip (also rubber, but about 15 inches or so in length). At the same location (at the vets), I am full quieting on low power (1.5 watts). I am also full quieting many miles further away (albeit on high power - 3.5 watts with 6 aa alkaline batteries). I can also sit in my living room with the handheld and open repeaters 40 miles away on Bristol Mountain. I suspect that with a gain antenna and tuning the radio you can get more than that. The thing here is what elevation you have. If you and a friend are on flat level road, you are not going to go much more than 5 miles or so between handhelds (unless someone is in a tree, or the second story of a house). The gain antenna is a BNC mount and cost me $18.00.
73s, Jim
PS - I would not personally put it on an FRS radio. The FCC tends to warn first time offenders who may not know, but I have a commercial license and I suspect they would hammer me pretty good!

Oooooh I see. The first ammendment free speach rights are way less importent than a few folks TALKING about modifying radios not in a way that may not be in strict compliance with the FCC regs. Aint no law against talk. Get a life pal.

No. Most natural gas service lines under
ground are plastic and this would be
also danger in a lighting strike.

1113. Super Modulation modification kits question.

Newsgroup: rec.radio.cb
Date: 2000-08-10 00:00:00 UTC
From: acheqa@my-deja.com
Message-ID: <8msv67$k42$1@nnrp1.deja.com>
Source record: 47604

Does anyone know how well those super modulation kits work?
I am thinking of installing one into a Cobra 148 GTL or Uniden Grant LT
if I can find the right one that really works.

I see H&Y has a Super LoudMouth mod,
I see Bill's 2-Way Radio has a kit called Uncle mod.
I see Copper's has one too.

Anyone use any of these modulation booster mods? And how did it
work out for you? Waste of money and time or not?

Or what is the best mod out there... I believe I may be thinking
of Swing Mod kits too...? Not sure if the ones I listed above are
considered under the category of Swing Mod or not.

Let's hear from the first hand experience crowd. Which one works
best to kick that modulation up to 100% even with my AM power output
turned up to 5 to 8 watts on the stock radio?

Thanks for the reply noid, I have noticed that these pieces of sh!t eat AA batteries like no tomorrow too! I ordered some DC power jacks that I hope will fit right into the space on the PC board left for them. At least that way I can power them from a DC power supply or a Car's cigarette lighter jack. I also tweaked the output up about one watt more than they were putting out. They also get splashed and splattered from adjacent channel stations real easy. Junk is the word that comes to mind. Oh well. That guy who is selling them on ebay must be laughing his way to the bank selling this garbage!

regards!

Well, don't want to bitch, but I sort of agree with Okie. I ordered a radio on 7-28-2000, called today, and found out it was still in the Tech shop being tuned. The website does say that it ships most in 2-3 days, but in some instances, it may take longer.

They did respond quickly and gave me an honest answer to my question though.

There is nothing wrong with wanting to get the most out of a radio possible. If there is a way that you can improve your distance, sound quality, or whatever by simply turning a pot, I will do it. As long as what I am doing isn't bothering someone else, why not?

he Daniel do you speak french, if not, are you able to talk
other language?
Anyway people like you are only frustrated people with no scientific
and open mind,
the purpose to make mod is not to splatter anywhere but to experiment
and try to get positive result with these little radio.

I agree with the clipping after turning all the way the deviation pot
but if you slighly increase the deviation you will notice
while listening with an other frs that the voice will be louder
therefore you will lose some clarity.
but if a people with low voice you will see the difference

I have noticed that the Telco and cable guys have used my natural gas pipe for their grounds so it must be pretty good. Like others have said, I wouldn't want to take a lightning hit on it. The trick to good RF grounding is to have the ground near the equipment. This is usually best provided by putting in a ground rod just for the radio.

>
> >>>DUHHH
>
> Toll Free

Uh, no.... Apparently you've equated swing with modulation... they're NOT the same. Simply put, modulation causes swing in an AM set. Apparently whomever posted those remarks doesn't really know how a radio works. I must admit, I've got only slightly more than a basic understanding of it myself.

When you talk into the mic, electronics in the radio and mic convert that sound to electrical impulses. Those impulses are then amplified, and injected into the synthesizer, which then mixes the carrier with the modulated audio, amplifies that, and transmits it.

Overdriving that first audio amp (overmodulating it)is what causes the fuzziness from too much modulation. That fuzziness also gets pushed into the synthesizer, which can't handle the extra current, which ends up "bleeding over" into adjacent channels.

Recall that I suggested reducing the carrier, and getting the modulation as close to 100% as possible. This causes more swing... Swing can be equated to the resolution of your computer monitor. The higher the resolution, the more data you can fit into a fixed space. More swing makes CLEANER audio at the same modulation percentage.

Yes, overmodulating a radio will make it swing harder, and waste RF energy on adjacent channels. Reducing the carrier and setting the modulation as close to 100% as possible will make the radio swing as well, and, as I said before, swing is the thing that makes your radio zing.

Dude, this applies to everything you buy, from cars to antenna towers....

AS LITTLE AS POSSIBLE. :)

Is the guy using it or is it just laying around? That will determine if
he's a "motivated seller ." :) Offer him fifty bucks and go from there.

Depends on what kind of tower it is. Rohn-25, for example goes
for about $30.00 per section, rohn-20 for about $20.00 per section.
For 'cheaper' towers, cheaper prices.

If the SWR is affected by positioning of the coax, mic, etc, you
have a problem some where. I'd be a bit uneasy about the 2.0:1 also.
Do all the usual things, make sure the radio is grounded well, coax
connectors are put on well, and no 'kinks' in the coax anywhere.
After that, if the SWR varies with movement of any of the above, I'd
take a close look at the antenna. Is it in good shape, fittings
tight,
etc.

Sounds like you DO have a problem in the antenna. You'd get a better
reading If you could use anything other than a mag-mount.
Also - you would theoretically improve SWR if you used RG-8 or RG-213 cable
rather than RG-58, though it would be somewhat stiffer to work with.

Hello Professor: Glad your all ears here!

The difference in the antennas, is the impedance matching devices. Wilson has a better, or lower loss impedance matching device. I believe the Wilson 1000 add tells of a lower loss impedance matching device or their bottom matching coil being made from 10 gauge silver plated wire. And a different dielectric the reduces the dielectric loss.

This is very believable to me. Testing the base antennas, I have seen as much a 6dB difference in field strength, between two similar antennas. The differences where the impedance matching devices. The impedance matching devices where the same design, but made from different sized materials. The stock factory equipped antenna was measured lower in field strength than a similar antenna with much larger diameter (lower loss) impedance matching device. This was double checked by swapping the impedance matching devices on the antennas, and seeing the old stock antenna now have 6dB more Field strength that a new antenna. Very repeatable. I did the test five times to verify it was true.

Another thing to consider is that the Wilson claims 58% or close to 2 dB less loss. When a amp is used who wants all the power to be lost in the impedance matching device? I set my K40 on fire one day while transmitting near a low lying wire. The wire may have made the loss in the impedance matching device go up, making it dissipate way to much heat, and literally catch fire.

The K40 and Wilson 1000 have cheap shit coax. I replaced the cheap-O RG58C
(incred-OH-cheapo) coax with RG142B Teflon coax, about $1.25 a foot but its now bullet proof.

Jay in the Great Mojave Desert, ...just down the road ah ways from the fillin station.

The Cat 3406C and E are computer controlled. The Cummins N14 and newer are now computer controlled. The Detroit series 60 is now computer controlled. Most of the fuel mileage improvements in todays deisels (yes, they're getting 6 to 7 mpg nowadays) are due to improved fuel curves because of the computer controlled engines...

Some companies have gone overboard with the CB thing... no cb's in the trucks is rediculous, and removes an important safety tool from the driver... Others don't allow linears, which is understandable... Of course, what the company doesn't know can't hurt the driver, until something happens to the computer....and then its all over.

GPS, in a way, has been in trucks since at least 1996, when I started driving, and probably before... Qualcomm's and HighwayMaster's, whenever they were introduced, allowed tracking down a specific truck to within a few miles for awhile...

Hope this helps fill in the holes.

Like I said, I have just a little more than a basic understanding....
I'm no pro at it... But bleedover is caused by overmodulation... Any
insights as to why?

And if the modulation doesn't go thru the synthesizer, then how is it
brought on the desired transmission freq?

Please straighten me out here... I'm curious... always wanna learn
something new.

Toll Free

Apparently you didn't READ what I said... or you're too thick to understand
it...

Modulation causes swing, an increase in power transmitted. Swing does not equal
modulation. If it did, you could check your percentage modulation based on your
carrier power : peak swing ratio....

If a radio keys 2 watts and swings to 18, does that mean it's at 900%
modulation? I don't think so.

Maybe some of the HAM's and others who really do know what the heck they're
talking about could fill me in on this...

According to the block diagram on the Cobra 148 (From which I got my information, the audio signal follows this path:

Mic -> 2 mike amps -> balance modulator -> FT3 filter -> xmit mixer -> predriver -> driver -> final...

I was trying to recall from memory, and I guess my memory ain't what it used to be. I have it sitting in front of me now.

So what, when the radio is overmodulated, gets overdriven that causes the bleedover? Is the Filter to blame? The xmit mixer? Somewhere in that circuit, something is getting overdriven, and causes transmission on frequencies adjacent to the one set by the synth/PLL. Someone fill me in, here?

At any rate, it seems from the block diagram that reducing the carrier to get more swing has nothing to do with overmodulation at all. It simply allows more swing.

And "setting" the modulation to 100% is as easy as injecting a signal into the mic output, or speaking into the mic at a constant volume, at the level you'd normally speak, and adjusting VR7 (on the 148/2000/GrantXL) for 100% modulation on a modulation meter, or if R131 has been pulled, adjusting the dynamike until you get as close to 100% as you can.

I was well aware that modulation isn't a constant... unless you're a robot, that is.

I admitted I don't know it all, and I'm still learning... I'd hope that, instead of calling names, and insulting people, someone out there would share the knowledge. I am, after all, here to learn. Someone fill me in?

The carrier on a Cobra 29/25 and Uniden PC76/66 can be reduced by replacing the bias jumper to the final with a resistor and electrolytic cap, negative side towards the final, in parallel. I have a 29 that's a good 10 years old, that's been run pretty hard that way for at least 8... haven't blown anything, and the meters show a 3 watt deadkey and a 25 watt swing. The final's been replaced with a 2312, but that was done before the other mod I just mentioned.

Sounds similar to what happens sometmes to 18's running power... but I've never heard of a CB interfering with electronics in a vehicle when its not transmitting... Very strange one indeed....

Like someone else said, as cheap as you can get it for.
Does it have channel iron style legs or round tubes?

I'd stay away from tip bases, seen to many of them give problems.

Inspect the holes where it bolts together. If there is any wear at all, give less. You can usually tell if it has been up awhile also. Look for cracks in the top plates.

On the channel style, check the angle rion where the u-bolt hold the pipe. Also look where the top plate fastens to the tower itself. They crack off. The bolds have a special shoulder on them to help center it in the hole.

$200 really wouldn't be unreasonable for a excellent shape tower, but you can find cheaper ones that have blemishes, or where they want to get rid of them. They might need a little maintnance. Just to give you an idea, a new Rohn HBX 40 ft tower costs $440. Most dealers would sell that tower for around 40 to 50 % markup from that price. A dealer would probably ask about 1/2 price for a used one.

It would probably cost you between 200-300 to get it installed by a business that does that kind of work. Concrete might be extra, usually around 60 bucks a yard and you should have about 1.5 yards of concrete.

Source record: 47677

Ya' know; you seem to be a bit clueless on this matter. Nobody is paying attention to your repetitive clatter. Most radio ops don't really give a rat's nether regions about the type acceptance. Those who might actually pay any attention to your rant are likely only doing so to set the filters on their email readers to block any posts from your email address (as I am about to do).

If you REALLY want to make a difference, try telling them something like this:

A.) Modulation>>On FRS - or ANY FM rig (even the 2970's) increasing the modulation does not, will not, CANNOT increase the power! It just doesn't work that way. The power output of a frequency modulated transmission does not vary from dead-key to screaming in the microphone. Period. Have you ever had a bad SSB rig that warbled when you pushed the mic gain? Maybe bad regulation on the slider voltage? Guess what, that warble is called FM. In FM, the power doesn't vary with modulation, the frequency does. That's why it's called Frequency Modulation. Now, the receivers on FM rigs do have a certain amount of selectivity (for the other old-timey CB'ers out there: think "Adjacent Channel Rejection"); that means the receivers can only "hear" so much off-frequency. You crank up the modulation on a FM rig; it warbles (tech term: "deviates") WAAAAAYY off frequency. The other guy's receiver can only hear so much off-frequency, then it loses it. Do you want really to crank it up so high the other guy can't hear you?
B.) "Sliding" How many other guys are gonna set up like you? Who ya' gonna talk to? Ever tried to carry on a conversation on 27.180AM? Wasn't there a bunch of bleedover from Ch 19? Was it worth it? FM isn't like SSB - it takes up considerably more bandwidth on a channel, so you're going to get more bleedover from the guys up on center-slot.
C.) "Cranking the watts". Har-de-har-har. These little guys are legally limited to 350mW. Anybody remember the old 2SC1969 finals in the second generation 40Ch SSB rigs? The FRS rigs are the same; if you're limited to roughly 1/3 of a watt, why spend money building a rig with finals that can do much more than 1/2 watt? Yep, 1/2 watt. And, by the way, after about 2 minutes of key-down, the brand-new batteries in your FRS rig will be so depleted that you're back down to 1/3 watt.

There you go. Instead of telling the "outlaws" that they're outlaws; I just explained to them why they're wasting their time!

Grounding to a natural gas pipe? You gotta be kidding! Tell me, what Telco services you? I want to make sure nobody from that company works in my shop! If you want to have some fun, tell the crew supervisor at either company that his guys grounded to a gas pipe. If he's worth a pimple on a decent wireline tech's backside; you'll get to see him turn all sorts of colors before he finds a tech to perform a foot-a** implant on! Here's a hint: think high-voltage electrical spark + explosive gas.

Send me a postcard from orbit!

If it is quiet (low noise, no other stations on frequency) you would be surprised at the distance you can cover even with low power. I personally talked, using only 12 watts output (on the power meter), to Webster NY from GUAM ISLAND - I am not sure of the exact distance, but it has to be approaching 10,000 miles! This was on 28 MHz - same propogation as you find on 27 MHz - on SSB. It also helps to have a good antenna up high (I was using a 6 element beam up 102 feet).

Source record: 47680

The hams aren't hacked because they lost 11 meters to CB. Most of the hams today don't even know that 11 meters was once a ham band. Hams get hacked when the overmoded, overmoded, splatter boxes cause interference up in the 10 meter band or unlicensed operators think it is their right to operate there.

Nope, all the mods do is reduce the carrier so it swings upward with modulation. This mostly causes splatter as many transmitters are over modulated. The results of the swing mods are no better that a properly modulated full carrier. All it does is make output and s-meters wildly swing which is what really thrills some folks.

Hmm... Am I seeing 'flames' started in these threads? Forget about the 'illegal' stuff and let's get practical. IF you are not prepared to 'channelize' these 'other' frequencies and make sure they are where you intend them, you will run into 'audio distortion'. I read various posts about increasing the 'gain'. Increasing the gain increases your deviation and will NOT increase your signal coverage. 'Sliding' between channels may put you not quite on the same frequency as the station you intend to talk to. FM is NOT AM nor SSB. The discriminators (FM demodulators) in the radios are purposely linear somewhat beyond what 'full modulation' is defined as - for a reason. If your signal wanders (either by overmodulating OR BEING SLIGHTLY OFF FREQUENCY), the receiving station will perceive 'audio distortion'. The demodulators must be linear over a range sufficient for 100% modulation PLUS any legal frequency mismatch between radios. If you are 5 KHz off frequency (this is at 450 MHz - 1 part per million will put you off by as much as 450 Hz, and the other station can be off a like amount), you will likely experience distortion in the received signal on one or both units. You can't simply 'slide' 5 KHz off frequency to avoid a strong signal - capture effect will kill that - the bandwidth of the receiver will be too wide - remember, this is FM. This is not to say it cannot be done, only that you will have to verify that the thing operates on proper 'channels', or at the very least, on the same frequency (within 1 KHz) of the intended station you wish to communicate with. BTW, FRS shares channels with business users - and adjacent channels may be for business users only. Changing the antenna (also illegal as we all know so please don't point this out) would be about the only guaranteed way to increase your range.

Just listen to the cw portion of 10 and the novice voice portion in
the low 300-350 range....it's more of a problem in big city areas with
taxis but I hear cbers beeping away on the cw portion ALL the time.
Not long ago some moron's kid was saying "HELLLLLLLOOOOO" over and
over and over again on 28.350 for quite awhile. Retarded echo, beeps
and all. then the dipshit old man got on an did the same thing.

Sounds like a grounding problem and your feeding back searching for ground.
Get you radio mounted to something metal and you might try one of those
lightening arrestors that go between the radio and antenna it has a screw
that will let you wire the antenna to ground.
What kind of power are you running to that shack antenna is it the small one
with the center coil?

1207. Can CB cause other electrical problems in the car? (long)

Newsgroup: rec.radio.cb
Date: 2000-08-11 00:00:00 UTC
From: scruit@nospam.yahoo.com
Message-ID: <39935a18.99522376@90.0.0.1>
Source record: 47698

I have a '95 Taurus with a Uniden Grant 76. I had a cheapo mag-mount antenna from radio shack and was getting an SWR of about 1.4.

As I was driving down the freeway, after about 100 miles (with the CB on all the time) the car started acting funny.

When I hit the brakes the transmission dropped into neutral and all the dash lights came on. I kept my foot off the brakes until the next rest stop and as I pulled into the rest stop I tapped the brakes a couple more times and it did the same thing. When I held the brakes down for a full second the engine stalled and I had to coast to a parking space. The CB has only been in place 2 days.

I turned the CB off and the car was fine. I turned the CB back on and hit the key and the antenna light came on. I checked the SWR and it was like 3.5-4, so I quit messing with the CB and went the rest of my jouney in silence. (no car problems at all)

Is it possible that a high SWR reading cold cause some kind of electrical malfunction in the rest of the car? I've been working on cars for many years (just installed a new engine in this one myself, 2k miles ago) and I can't explain it other than maybe a short. The CB's power is spliced into the stereo power wire. The CB is mounted where the ashtray used to be, under the center of the dash, and the antenna wire runs across the floor straight back along the transmission tunnel, is tucked under the back seat and out the passenger door to the magmount antenna.

Any advice or comments welcome!

Thanks,

Graeme J Quinn

I don't have a clue about what swing is unless it is like DSB reduced carrier. People keep talking about turning the carrier down. The only kind of radio I know you can do this on is a SSB radio that will do AM. There are two ways you can get AM on an SSB radio

1 Bypass the SSB filter and unbalance the modulator so a carrier and both sidebands comes through.
2 Reinject the carrier at some point and bypass the filter.

Either of these methods would allow for reducing the carrier independetly of the sidebands. Is this what thats going on with swing.

I think the FCC has given up caring how you operate as long as you keep it "in the band". If all you are doing is bothering other CBers they don't care. Now if you are jamming some airports approach freq then it is another story. They will be on you like white on rice.

Sideband, you made a mistake in your instructions above on adjusting for more
modulation on the (on the Cobra2000 GTL) radios. VR7 does NOT increase the
modulation
of the radio! It is the calibration adjustment for the modulation meter only!
That is, when you

modulate the AM carrier signal to 100% with a tone, you then adjust VR7 so that the modulation
meter on the Cobra 2000 reads 100%. It is for the modulation meter reading only!
By turning up VR7, you are only increasing the sensitivity of the mod meter and not the
actual modulation level of the radio itself!

Unit 824, Audioman out!

> brought on the desired transmission freq?

The synthesizer is the circuit that sets the frequency that will be transmitted. This weak signal goes through several stages of amplification to raise it to sufficient level to drive the final rf amplifier. In the case of a AM transmitter the modulation is applied to the final radio frequency amplifier stage, not at the synthesizer. In an SSB transmitter the rf signal from the synthesizer is applied to a balanced modulator which when in a balanced state there is no rf output from the balanced modulator Audio is also applied to this balanced modulator. The audio unbalances the balanced modulator and this produces a double sideband, suppressed carrier signal. This signal is then passed through a filter to cut off one of the sidebands and this SSB signal is then amplified to the proper output level. Because there is no output from the balanced modulator when no audio modulation is applied is why there is no output from an SSB transmitter when there is no modulation.

hello
when you slide the tx freq the rx will follow.
I have tried it with two brand of frs
cobra frs250 and sylvania frs200
so you will sound clear if the two radio are on the same slided
frequency it's work very well and nobody with other frs can hear you
the purpose to increase deviation is to help people with low vlolume voice
of course if a person talk louder in mic it will over drive the deviation

hack and talk
waving the hand

See previous post, the synthesizer is before the balance modulator. The audio is applied to the balanced modulator, not to the synthesizer.

>

When you over modulate the peaks of the signal are clipped or flat-topped and this causes spurious frequencies to be generated which will cause interference to adjacent channels.

>
> At any rate, it seems from the block diagram that reducing the carrier to get more
> swing has nothing to do with overmodulation at all. It simply allows more swing.

In an SSB transmitter there is no output signal until modulation is applied so a swinging output from an SSB transmitter is expected. As long as the audio circuits can supply enough audio to drive the balance modulator to the proper level there is no reason for any kind of mod to get more swing. Usually when they talk about these swing kits, they are for AM rigs.

Hi Nick,
As an un-scientific rule-of-thumb, figure about 10 amps per 100 watts of output power. You might get away with using the cig-lighter with just the radio, but DEFINATELY NOT with even a 'small' amp! It is always best to wire you gear directly to the battery. I personally use the Radio Shack polarized interlocking connectors (catalog numbers 274-151 and 274-154) in each of my vehicles. And they work fine with an HR-2510 radio and a 400 watt amp. (Oops...them aint legal)

Also, the cig-lighter uses small 14-16 gauge wire which simply CANNOT handle hi-amperage draws.You might only get between 5-8 amps thru the cig-lighter. If you do go directly to the battery, use at LEAST 10 gauge wire.

Ray

Graeme,
If you had, or have the problem with out transmitting, it
isn't the CB. I'd check to see if you haven't developed a
short in the computer harness.
If it happens while transmitting, then cover the wiring
harness with torroids (as close to the computer as possible).
While I doubt if it has anything to do with the problem
your having, 'piggy-backing' power for the CB from any other
device, or the fuse block isn't the best idea.
'Doc

If you modulate an AM carrier with more then 100%, then the negative peak (null?) drops below zero. This switching on and off of the carrier generates harmonics that splatter the band.

It is possible to clip the negative audio so you dont cut off the carrier on
neg peaks. This is "super modulation" but probably not the super moduation
they talk about in the mod.

JR:

Ok.. thanks for this... it actually makes some sense. Throwing an unbalanced input into a balanced I/O would make an output... Something like a logical OR gate.

But it still doesn't answer the overmodulation question I had posted, nor does it explain how reducing the carrier supposedly causes bleedover and overmodulation.

Could ya fill me in there?

Ok.. now THAT makes sense.
Thanks, Scott.

Hrm...interesting... but there's a VR7 in the 148 and the Grant XL as well, and they don't have modulation meters... or any of the electronics to drive one. So why have VR7 in a radio to tune a nonexistent modulation meter?

> >
> > -SSB

Ok... On Single side band, I can understand this, but the original question was based on an AM
transmitter... The GrantXL/148/2000 have AM mode, and I've reduced the carrier to between 2 and
3 watts on all my radios. I even did a before and after check with a friend of mine to see what
the results were. He, and many others, commented that the radio sounded much better with the
carrier reduced to 2 watts. All my GrantXL's and 148's swing to between 17 and 19 watts. They
sounded better on AM with the carrier set to 2 and swinging to what they'll do, than they did
at 4. So what's the story here?

It seems that the radio performs better with a lowered carrier and more swing, at close to 100%
modulation... so in effect, I wasn't wrong... I don't bleed over more because I've reduced the
carrier and let the radio swing more. I've even tested this.. 1/4 mile away from my
transmitter, I have no bleedover on 18 or 27.195 when I transmit on 19, on a clear
night....
Now unless my friend who helped me test this out was lying, it seems that I'm not bleeding over
any more with a reduced carrier than I was with the carrier set to 4 watts.

So why did someone jump down my throat about reducing the carrier causing overmodulation? I
don't know... I'd like the explanation to this as well.

Nice radio for sale. Top and bottom case is missing. The power cord got lost when the microphone got gone. The circuit board was taken out and left at a shop that went out of business.The speaker has a hole in it(small problem) Everything else is fine. $200. takes it all. Only one like this so when it's gone it's gone. Thank's. This price does not include shipping.Also the owners manual will be included.

Tired of constantly being broke, and stuck in an unhappy marriage, a young husband decided to solve both problems by taking out a large insurance policy on his wife (with himself as the beneficiary), and arranging to have her killed. A "friend of a friend" put him in touch with a nefarious underworld figure, who went by the name of "Artie".

Artie explained to the husband that his going price for snuffing out a spouse was $5,000. The husband said he was willing to pay that amount, but that he wouldn't have any cash on hand until he could collect his wife's insurance money. Artie insisted on being paid SOMETHING up front.

The man opened up his wallet, displaying the single dollar bill that rested inside. Artie sighed, rolled his eyes, and reluctantly agreed to accept the dollar as down payment for the dirty deed.

A few days later, Artie followed the man's wife to the local Safeway grocery store. There, he surprised her in the produce department, and proceeded to strangle her with his gloved hands. As the poor unsuspecting woman drew her last breath and slumped to the floor, the manager of the produce department stumbled unexpectedly onto the scene. Unwilling to leave any witnesses behind, Artie had no choice but to strangle the produce manager as well.

Unknown to Artie, the entire proceedings were captured by hidden cameras and observed by the store's security guard, who immediately called the police. Artie was caught and arrested before he could leave the

store.
Under intense questioning at the police station, Artie revealed
the
sordid plan, including his financial arrangements with the
hapless
husband.
.
DRUM ROLL
.
(PAUSE)
.
And that is why, the next day in the newspaper, the headline
declared.
ARTIE CHOKES TWO FOR A DOLLAR AT SAFEWAY."

I am not an "amp builder". If I was I could care less about "Taking the
country by storm" I have a legit way of paying my bills. I keep my hobbies
as hobbies and work as work, don't won't to get them mixed up.

You could use a Yagi maybe and if you had line of site between the units it would probably work. FRS freqs are very sensitive to line of site.

Thanks and It works as good as it looks. You were right about wire wound resistors on the swamping network on that box. When I got home I cut one open again to double check and this time I noticed a very fine wire wrapped around it. I was suspicious the first time but must have over looked it. Good looking out Boo. Needless to say the big man In the grass is very happy with it.

Hi Damien,

The key point that is being missed here is that SWR tells you nothing about the radiation efficiency of a antenna. All a 1 to 1 SWR reading tells you is that the point that the SWR meter is inserted at is a close approximation of 50 Ohm impedance. If the insertion point is at the antenna feed point, then the most you can say is the antenna is matched. That still is no measure of how efficient a radiator the antenna is. If the RS antenna you have has a whip less than about 56" long or so, and/or the loading coil is made of small gauge, close spaced wire wound on a small diameter coil form then yes, a Wilson 1000/5000, or similar type antenna would be an improvement.

Reducing the carier does cause overmodulation. To 100% modulate a 100 watt carrier it takes 50 watts of audio.I ypu have 80 watts of carrier it takes 40 watts of audio to modulate it. So if you reduce the 100 watt carrier to 80 without reducing the audio power you will be overmodulating. You can get away with this to a point by limiting the negative excursions of the modulator. Normally it is considered acceptable to modulate on the positive peaks up to 110% but obviously a lot of people push it past this.

Yeah, but when a zero bias amp that has a conduction angle of 179 degrees is touted as a high-efficiency class c amp, that is stretching it a bit to say the least.

Very few class "C" amplifiers, with or without bias, are anywhere
near a conduction angle of 179*. Most are closer to 50* than 180*.

Hamm:

Ok.. Now we're in the part that I don't understand.. Where do these numbers come from? Am I to infer that 50% of the carrier power is required to modulate the signal 100%? If that's the case, then my GrantXL, keying 2 and swinging to 18, has 100% modulation at 3 watts output, and is at 1600% at 18 watts?

Somehow that doesn't sound right.1600% modulation would sound distorted and almost completely unreadable, and yet I get comments constantly on how "clean" my radios sound. That is, pure of tone and completely easily readable. So what did I unknowingly do right?

All I've done to the radios is modify the PLL, open the clarifier, pull R131, tune the transmitter, reduce the carrier to 2 watts, and put it all back together. So how am I getting such a clean signal from something that, according to you, should be so overmodulated as to be unreadable?

I'm not trying to sound cocky, I'm sincerely curious as to how this works...

And you're welcome to visit and hear one of my sets, and then check them out on whatever meter set you wish. Just let me know.

A properly modified radio will swing to the same (peak value) no matter were you set the carrier.

: wondering how would you put it in? anyone know? thanks

If you had a diagram on the amplifier and sent me a copy, I'd tell you what's required to add the delay. It's kind of hard to do it via Email without one and you'd need to have some basic electronics.

There's a "t/r" (transmit/receive) circuit which senses your radios rf and switches the tr relay back and forth. It's often a simple transistor circuit, but older tube amplifiers often included a small tube for the switch control. Part of that circuits time contant is changed for longer hold time on transmit unkey.

So it is particular to your amplifier, a really good tech should know how and what to do. If you have the diagram and need some help, pop me an Email and I'll help you where I can.

cheers

If it operates at 179 degrees then it is a LOW efficiency class C amp.

No your figuring is just bad, that not how you calculate percentage of
modulation. Any transmitter will produce 4 times the power on modulated peaks
as it does on a dead carrier. 4 watts when 100% modulated will give 16 watts on
modulation peaks. Would not be too hard to push this to 18 if you were

overmodulating a bit or Super modulating as I discribed. You would have have 48 watt peaks on a 3 watt carrier for 200% or 12watt peaks for 100% so you see your 18 watts is not that much of a stretch . As long as the neg peaks are not cutting off the carrier it should sound fairly decent. I 've done a little research lately and the bootstrap modulator that AM only CBs use should be pretty much ideal for this type of modulation because they inherently limit negative excursions. Now that I have found out what swing is I know that it is nothing new and has been around just about as long as AM. In contrast the old tranformer coupled modulators would sound awful used like this because they had no neg limiting at all. Not to say it could not be added. Believe me , its been done a long long time ago.

> But after reading this I'm sure some dumb-ass will still tell me that
> a "no-bias" amplifier is not class "C"...

I'll volunteer for the dumb-ass award. On this one specific item (Class C is less than 180 deg conduction angle) no argument. What has set off numerous arguments is that you then extend that terminology beyond that point in certain specific areas, mostly assuming that 179 degrees gives you the efficiency of the classic 120 degree, near square-wave Class C operation used in FM and plate-modulated AM finals with none of the other results. This is simply flatulent.

A. Zero bias operation with bi-polar transistors does indeed imply Class C operation. Tubes and FETs have some different opinions. Look up the EiMac 3-500Z (triode, 500 watt plate dissipation, Zero bias) and you will run a good Class B. But the .7 volt forward breakover voltage of a bi-polar does imply a conduction angle less, but not a whole hell of a lot less, than 180 degrees. I note this to point out a certain amount of slop in your Kantian categorical imperatives and also to ask just what miracles do you expect out of 178 degree operation that do not occur at 182.

B. The efficiency of the classic Class C final is gained by using a gate/base/grid leak resistor (may be an RFC in lo-impedance bi-polar designs) to increase bias and clip the lower portions of a waveform while the top portions drive into saturation. The idea is to energize a high-Q tank like whacking a Chinese gong with a big hammer and let it re-generate a good sine-wave output. Any amplitude variations disappear in the output; indeed this characteristic is often used in FM receivers in stages called 'limiters' to remove amplitude variations in the i.f. chain and produce the wondrous noise-free detection. It is this brute force approach that produces the 75-80 percent efficiencies that you seem to believe come automatically at 179 degrees.

As it happens, I have a certain admiration for your approach for no better reason than it closely matches commercial approaches to similar problems. Certainly such minor items as impedance matching have not generally received the attention you have given them. I have no doubt that the small deviation from Class B that zero-bias operation implies causes any unacceptable distortion. But it doesn't produce 75 percent efficiency either.

The summation of your argument is that zero-bias = Class C = 75%+ efficiency which comes of using a dictionary rather than good sense. You use Class C in an incomplete and rather selective manner. Not a great wonder that arguments get started.

In another post you claim 100 watts RMS from 133 watts in, or 75 percent. I am not calling you a liar but I rather suspect that somewhat optimistic meters read by somewhat optimistic meter-readers is about 10-15 percent of that. You apparently have a good, clean amp of good people-sized output that should reliably do what it was designed to do at reasonable expense. By being clean and relatively non-distorting you probably achieve communication efficiency well in excess of some higher-powered pieces of crap. Pretty decent engineering and execution for which you should be awarded at least a nine-inch Hero of the Republic medal with crossed squirt-gun clusters. Why in hell are you bucking for the Nobel Prize?

Hrm....

So how am I getting a clean sound, with the mods I've described, keying 2 and swinging to 18 on my 148's and GrantXL's? According to these figures, 1:4 * 2 = 8 watts at 100%... I'm doing 10 watts more than that, on average. According to your figures, my radios are vastly overmodulated. The scope, and mine and others' ears say different. (Again, I'm not trying to be argumentative, I'm trying to understand.)

Like I said, all I've done is pulled R131 out of the AMC, giving TR26 nowhere to dump to. I've also found that somewhere between 1 and 2 o'clock on the dynamike/mic gain gives 100% modulation in this setup.. So either my radios aren't really swinging to 18 watts, and 10 or more sets of meters are wrong, or I'm still so overmodulated as to be unreadable...

I guess I just don't get it.

Asswipe, I was competing and winning trophys in the 80s before you knew what a CB radio was!

I remember winning DC Sky with a 16 pill Messenger in LA in 1988.

Some of us have "Been their, Done that".

1326. Uniden PC 68LTW any good?

Newsgroup: rec.radio.cb
Date: 2000-08-11 00:00:00 UTC
From: sawmill@mediaone.net
Message-ID: <3994B462.1DDE877C@mediaone.net>
Source record: 47867

I have an old Globe CB from the mid 70s that I have used for 25 years but I want to get a new CB. The Uniden PC 68LTW is $80 at a store near me then there is a $20 rebate on top of that. Is this a decent radio?

Thanks for any information you can provide.

VR7 isn't in the 148? Hrm.... Odd...

I have a 148 GTL, manufactured 199304 in Malaysia. What's that little turny deal in the back of the radio by that big transformer looking thing? The one that's labled... guess what... VR7.

I've also got a Uniden Grant XL, manufactured in the Phillipines. No date on it (none of my Grant XL's have dates on them) and, oh my god, in the back of the radio, by the yellow driver/final (I'm not sure which one) bias wire, near the big transformer lookin thingy, is, guess what? VR7....

Guess you should get your facts straight.....

Just my two cents.

I have been a CBer longer than I have been a ham and have been on this group longer than I have been on the ham ones. I just got my license a few weeks ago. The point I was trying to make was that since that was a Ham poll that CBers would not give a damn about it and would not fill it out. CBers that are hams (or Hams that are CBers whichever way you want to look at it) might have filled it out but not just CBers. I, and a lot of people I know, don't care about those things. And like I said, the poster was just trying to ruffle some feathers.

Graeme,
Your started in the right direction, just need more of the
same, sorta.
Use 0.01 or 0.1 ceramic capacitors rated for at least 35 volts
(higher voltage rating won't hurt a thing). On the fuel pump, add
another capacitor.
To supress noise from the coil(ignition) don't try to use a cap',
use a choke. They look like a transformer, and you definitely need
to watch voltage ratings.
Ford's need ferrite 'beads'(torroids) on the computer harness,
everything comming out of the computer needs to have torroids on it.
On very bad cases, wrapping the computer with a metal foil then
grounding the foil helps, BUT, you have to make proveision for
cooling.
Putting a bypass-capacitor on the power leads at the back of the
radio helps.
One way of telling if the interference (noise) is comming in
through
the power line, or picked up by the antenna, is to disconnect the
antenna and see if the noise is still there. Gives you an idea of
where to start 'fixing' problems.
'Doc

Source record: 47800

Not that I am any expert on the subject,but it seems that you may have to use a lower value capacitor to get rid of some of these noises,since they are gennerally higher frequencies and motor noise may have multiple frequency content.You may have to try a coil/capacitor combination especially on the line feeding the radio.You could look for one of those devices that bolt to the firewall and have 2 studs on top to pass the power thru for the radio.One of those devices usually have a capacitor from each stud to ground(mounting tab) and a coil between the 2 studs.I used one of these to get rid of alternator whine and the high speed fan noise.As far as the ignition noise,if you have worn spark plug wires,or improper mounting/routing of wires,this could contribute to the problem.Look closely at the coil,make sure that you attach any filtering to the supply side of it and not the distributer or tach terminal.It is not necessarily always the positive side depending on the design of the system.
Also,if you could borrow a magnetic mount antenna for test purposes,or a different style,possibly on a steel mount passing under the rear bumper,and bolted to the frame,you may find that the present antenna is more susceptable to noise,especially since they don't have a conventional type ground plane.
If you find you need to do some shielding on your wiring,automotive speed shops sell braided steel wire covering or you could use the foil type duct tape that is more like an adhesive tin foil.
Just a few of the things that I've had to do to try and solve simular problems.
otherwise,here is a link to a .pdf file wich requires adobe acrobat installed to read.It has a lot of technical explanation of R.F.I.(Radio frequency interference).
http://www.arrl.org/tis/info/pdf/001qex32.pdf

You will have to weed thru it for some of the procedures used to solve problems like this.I saw some specifics on fuel pump noise.You could also do a search on R.F.I and find a millionsources of info.
Good Luck

Pretty good, Hillbilly.

.....

Tired of constantly being broke, and stuck in an unhappy marriage, a young husband decided to solve both problems by taking out a large insurance policy on his wife (with himself as the beneficiary), and arranging to have her killed. A "friend of a friend" put him in touch with a nefarious underworld figure, who went by the name of "Artie".

Artie explained to the husband that his going price for snuffing out a spouse was $5,000. The husband said he was willing to pay that amount, but that he wouldn't have any cash on hand until he could collect his wife's insurance money. Artie insisted on being paid SOMETHING up front.

The man opened up his wallet, displaying the single dollar bill that rested inside. Artie sighed, rolled his eyes, and reluctantly agreed to accept the dollar as down payment for the dirty deed.

A few days later, Artie followed the man's wife to the local Safeway grocery store. There, he surprised her in the produce department, and proceeded to strangle her with his gloved hands. As the poor unsuspecting woman drew her last breath and slumped to the floor, the manager of the produce department stumbled unexpectedly onto the scene. Unwilling to leave any witnesses behind, Artie had no choice but to strangle the produce manager as well.

Unknown to Artie, the entire proceedings were captured by hidden cameras

and observed by the store's security guard, who immediately called the
police. Artie was caught and arrested before he could leave the store.
Under intense questioning at the police station, Artie revealed the
sordid plan, including his financial arrangements with the hapless
husband.
.
DRUM ROLL
.
(PAUSE)
.
And that is why, the next day in the newspaper, the headline declared.
ARTIE CHOKES TWO FOR A DOLLAR AT SAFEWAY."

I still think that 90 percent of your problem is the result of that glue-on antenna. Electrical devices in a car are going to generate some hash, but in a late model car I wouldn't expect to find so many components causing a problem. Using a capacitor eliminates noise coming in from the electrical system but since you used a separate battery with the same result, that precludes much of this. By the way 470 mf seems like a lot of capacitance for this sort of thing. Since you had some results on the fuel filter, try something much smaller, perhaps a disk cap in the range of less than 50 pf.

Try connecting the center conductor of a piece of coax to a piece of metal near the car to act as a receiving antenna--something with some size to it with alot of surface area. My guess is that the signal you're hearing is so badly attenuated by the glass mounted antenna that you are hearing the auto electrics over the radio signal. Remember what happens on the AM radio when you try to tune a distant weak station? You hear electrical noises, right? Same thing here. There are a number of adequate magnetic mounted antennas that will work just fine and you won't have to drill a hole.

Get rid of the antenna go to a mag mount Wilson 1000 or 5000 if you don't
want to drill the body. The antenna is not only detrimental to the radio
they don't work worth a Sh@#.
>
>
> The sources of noise are;
>

> with engine running)

This will be your greatest noise source and most difficult to fix. Ford
sells a RFI module that is soldered into the lines in the fuel pump which is
in the tank. You have to drop the tank.
The Ford Part Number is F1PZ-18B925-A The article # (I think is the TSB#)
98-7-3
The other problems will be easy compared to this and usually the radio noise
blanker will take care of them.
The book time if you have the work done by Ford is 1.4 hours 980703BA is the
operation #.
>
> - Ignition (crackling in time with the engine)
This could be a leaky ditributor or plug wires. If they are old replace
them. If not don't spend the money just for the radio it may not solve the
problem.
>
> - Windshield wipers (noise only when wipers are on)
Difficult with multi speed motors.
>
> - Blower motor (only on high)
Run it on low

Same chassis as the PC 66 will tune up to the mid 20's output excellent receiver. With a larger final installed mid 30's power out. You might try www.uniden.com and check their prices.

Interesting question. I would not, under most circumstances, report any radio operator (CB or ham). I also would not, under most circumstances, report someone for violating the noise ordinance in my city. I do, however, work a fireman's schedule - two 12 hour days followed by two 12 hour nights. I tried once talking to someone with that BANG BOOM BANG going on and got nowhere. Now, if someone bothers my sleep, I dial 911 and don't give it a thought. Oh, I try and tolorate it within reason, but I had a neighbor who had this mess going from 11 at night until 3 or 4 am EVERY THURSDAY, FRIDAY, SATURDAY, and SUNDAY night! BTW - I now have a sound system capable of exceeding the threshold of pain and have several recordings of John Phillips Sousa. Same way with radio. This in not unlike the radio operators. I don't think most people mind if you work skip or run an amp. The problem happens when one individual continually jumps on another's ability to enjoy their radio (or television, or whatever). I think this gets a few agitated (their right to do what they want), then the hams flame the CB boards, the CBers flame the hams. Lighten up! It's a hobby. Have fun, just understand that limits can be reached and exceeded. What would you do with my (former) noise problem? Suppose my noise problem was YOUR RF problem? Then what? Thanks for listening (I'm not complaining, merely explaining a similar problem I had). Need we all flame each other? Hey, have a gooder!

True. I was thinking in line with 3 or more trying for the same
frequency. The standard we used for business band FM was it MUST be
closer than 1 KHz of frequency - and we might tweak it if it were over
500 Hz from channel designated frequency. Generally, the radios are
set up properly from the factory. Have a gooder!

Quoth scruit@nospam.yahoo.com (Graeme J Quinn), On Sat, 12 Aug 2000 01:21:58 GMT

For those who say get a mag-mount instead of a thru-glass... I got the thru-glass because thise noise was just as evident with my mag-mount, and the swr on the mag-mount was normally 1.4 but without changine things the swr would suddenly become over 3, and then go back down, all in the same journey.

What kind of antenna should I get to give me the best starting position for eliminating noise? (remembering that I can't drill the bodywork)

Thanks,
Grae

OK - I'll try that. Should the caps go in parallel or in series?

> Ford's need ferrite 'beads'(torroids) on the computer harness,

What size, and would this be between the power & ground, or power &
vehicle chassis?

> One way of telling if the interference (noise) is comming in
>through
>the power line, or picked up by the antenna, is to disconnect the
>antenna and see if the noise is still there. Gives you an idea of
>where to start 'fixing' problems.

It's definitely coming through the antenna, because if I run the cb
from a spare battery the sound is just as loud.

I just replaced the thru-glass antenna with my old mag-mount. The
noise is less, but I can't get the SWR lower than 1.8. Right now the
noises that are the biggest problem are still the fuel pump, blower
motor and ignition. The blower motor I can live with because it is
only noticeable on high.

If the interferance is coming through the antenna, then will the caps
help at all? I thought they only made a difference if the noise was
coming through the power?

Thanks,
Grae

Well, first you said you were doing 3 watts carrier and swinging 18, now it is 2. make up your mind.

I talked with a guy tonight that had one on his radio. I watched his signal on a spectrum analyser that was connected to the I.F. output on my modulatoin monitor. The carrrier was bouncing up and down with the audio Not suppose to do this, at least that is what I was told..Trapezoid pattern looked really funky too. I know it does not do it without the mod and super modulation does not cause this either. His sig looked a lot like when you get AC hum on a linear amp but instad of 60 cycles it was voice. Don't know if this is typical as it is the first one I have looked at. Hell, maybe it is a gimmick just to make the meters swing. Ive got 10 days off and can't go on the vacation I had planned. I will look at it some more between honey-dos

Yeah, It is a little more involved than just adding a cap. The cap would make it slow coming on. The cap has to charge quick and discharge slowly. I hate RF activated relays. I had rather wire something up on the mike to key it or use a footswitch. Ideally I like to key the amp and let the amp key the radio.

No, I said the 29 was keying 3.. the 148's and Grants are set between 2 and 3...closer to 2

I haven't put the super mod in any of my radios... and I won't... It's not necessary.

1367. Re: Noise supression - Need basic advice

Newsgroup: rec.radio.cb
Date: 2000-08-12 00:00:00 UTC
From: 'Doc <w5lz@oio.net>
Message-ID: <3994E6F5.3B5310A3@oio.net>
Source record: 47823

Graeme,
All by-pass capacitors go from the 'hot' side, or (+) lead
to ground. The ground can be the (-) lead if there is one, or
to any handy ground point as long as it's close to the connection
of cap' and (+) lead. The capacitors go in parallel to the device
your 'by-passing'.
Torroids come in all sizes and shapes. One of the common ones
(from Radio Shack) are rectangular and clip together. They can be
opened up, placed around a cable/wire/harness, and re-assymbled.
It usually takes more than one if used on large cables. Small wires
can be wrapped to make several turns on the torroid.
A by-pass capacitor for the radio's power lead can be almost
any size, 0.1mfd or larger. The important thing is to get a cap'
with a voltage rating at least 2 times the voltage it's going to
handle. For 12 volts use a 35 volt cap', since that's only one
size larger than what you would need. A higher voltage rating doesn't
hurt, one too small will.
It sounds like you have a 'radiated' noise problem, but by-passing
the power leads of the radio, and the power lines of the items on the
vehicle will stop some of the radiated noise... every little bit
helps.
'Doc

>
: I'm chasing a few sources of noise interferance in my cb setup in my
: '95 Taurus. The CB is a Uniden Grant 76, and the antenna is a
: thru-glass type (I can't drill the car for a permanent one)

Most of your efforts are being wasted, as long as you insist on using
that antenna. Even a mag mount antenna where you feed the coax in through
a partly open window would be better.

First, find out if the noise is from the antenna/coax or the power. From
your descriptions, I suspect from the antenna and coax. To do this, just
disconnect the coax at the rig. If the noise is still there, it is coming
in over the power/ground leads - or being directly picked up by the radio.

If it goes away - then the antenna/coax is the culprit.

:> - Put a 470 MFD capacitor between the fuel pump power and the body
:> with cap negative to the body, about 12 inches from the fuel pump (the
:> closest I can get) - Reduced fuel pump noise by about 1/3

Try a second capacitor in parallel. If that helps, but does not stop it,
then a series inductor (generator whine kit) might do the trick.

:> - Grounded the fuel tank to the body (well, the fuel pump is inside
:> it and I thought it would act as a good shield... ;-) No difference

The fuel tank will already be grounded. You need to use a capacitor between
the pump power and ground. Check with your car dealer - they may have a kit
for this purpose.

:> - Put a 470 MFD between the wiper motor power wire and body, with cap
:> negative to ground. I was able to connect to the power wire right at
:> the motor. Absolutely no difference.

Wiper motor noise tends to be hard to eliminate. It is very broad band.
An in-line inductor might help - so might more capacitance to ground.

:> - Grounded the antenna via antenna instructions. No difference.

Not surprising. This type of antenna seems to have almost as good of
reception on the inside piece of coax as it has when the antenna is
attached.

:> - Installed a 10g wire directly to the battery, routed it away from
:> all other wiring and connected it to the CB power. I connected the CB
:> ground to the bodywork about 3" from the CB. No difference.

That will not necessarily help with noise. The wire size has little
effect on how much noise is picked up by the wire.

:> - Run the cb from a spare car battery. Still got the noise just as
:> loud.

Maybe all the noise is being picked up by that awful antenna and coax
that you have.

:> - Installed a 470 MFD capacitor from the + on the coil to the body.
:> The car would not start. Removed it, and the car started.

Yep. You canna' do that. You need a series inductor (choke) instead.

Graeme J Quinn <scruit@nospam.yahoo.com> wrote:

:> Use 0.01 or 0.1 ceramic capacitors rated for at least 35 volts
:>(higher voltage rating won't hurt a thing). On the fuel pump, add
:>another capacitor.

: OK - I'll try that. Should the caps go in parallel or in series?

Parallel.

: I just replaced the thru-glass antenna with my old mag-mount. The
: noise is less, but I can't get the SWR lower than 1.8. Right now the
: noises that are the biggest problem are still the fuel pump, blower
: motor and ignition. The blower motor I can live with because it is
: only noticeable on high.

Try moving the coax around a bit - and see if the noise level changes.
Don't worry about a 1.8:1 SWR - that is fine.

: If the interferance is coming through the antenna, then will the caps
: help at all? I thought they only made a difference if the noise was
: coming through the power?

No. Caps on the noise sources help shunt that noise to ground - where
you want it to go.

1370. Looking for info on old 23 ch. SSB Sears radio

Newsgroup: rec.radio.cb
Date: 2000-08-12 00:00:00 UTC
From: gadget <gadget@jnlk.com>
Message-ID: <8n32fl$36a$1@nnrp1.deja.com>
Source record: 47826

I have an old AM/SSB Sears base/mobile radio model # 934.36772600. I
am looking for the AM modulation limiter, and the SSB power limiter.
Right now, the radio is maxed out at 8 watts SSB, and 2 swinging 4 RMS
on AM. The modulation meter will go just above 100%. If anyone knows
any tricks on this old junker, I'd appreciate it. Thanks!!

Yes... class "C" (no bias). 75% efficiency is right. You can see a picture of the prototype it at the link by my signature. I would recommend a #12AWG wire no longer than three feet in length from the lighter to assure maximum power.

Source record: 47846

I received an E-Mail from someone who chastized me for suggesting that there is a theoretical difference between RG8/213 vs. RG/58. SO - let me expand. The difference IS THEORETICAL. In short runs, such as in automotive use -there is no PRACTICAL advantage. RG8 is more expensive and more difficult to work with- hence, RG/58 is usually reccomended. However, in long cable runs, there would be an advantage to the more expensive RG8/213.

James Shelton wrote in message

who is the dumb hillbilly to put a amp on a CB anyway? Not getting
enough noise from your "toy"?

--
*** "Have a real nice day!" ***

Mike
Fairbanks, AK

What's most outrageous is the Clinton Department of Justice suit
against tobacco companies. The federal government can't claim tobacco
manufacturers duped them. Since 1964, there's been a federal mandate
that cigarette packs contain warning labels. On top of that, for
years, until 1974, the federal government passed out free cigarettes
to servicemen.

The Democratic equivalent of a tax pledge this year seems to be: Read
my lips -- no new tax relief!

The whole key to efficiency is to keep the device, whether transistor,
tube, or whatever, out of it's linear region as much as possible.
Class a devices are always conducting. As input signal approaches
zero, so does efficiency. The maximum theoretical efficiency of a
class A amp (assuming a sine wave input) would be 50%, with typical
efficiencies half of that. The switchmode amplifiers can run over 90% -
and one of the universities in California published the prints for a
500 watt output amplifier with only 550 watts in. Including drive
requirements, it peaked at around 91% efficiency - and they offered
(and may still offer) a kit for fifty dollars! Obviously, this was
good only for CW or FM (these amps can be modified to enable them to
become 'linear', but it ain't easy!). But Professor, I thought a 'no-
bias' amp was an amplifier that was politically correct!

Sounds good, but it won't work. UHF television does NOT include the
450 MHz range and the UHF tv antenna won't resonate on FRS
frequencies. Also, with the high SWR (antenna isn't tuned) your coax
will suffer tremendous losses. But a nice idea anyways.

I have a question. Is that one pill class 'C'? The numbers you show would indicate over 75% efficiency .... also, what about IR loss? I don't know how long the feed is for the cigarette lighter is, but when you only have 13.6 volts or so, even a small loss can hurt. I know we had to pull some wire for a 30 amp load. I was told 10 ga. (which is the correct size for the load - IF the ir loss is ok). When my boss called, I had some real answers. It was 110 volts, 30 amps ... but over 250 feet, one way! We needed 2 ga wire to achieve a 2.5% regulation at the load. No, we didn't use 10 ga.

Hmmmm, speaking of prozac, perhaps you should have your meds checked... And please, feel free to come on over and try any mischief you feel might give you your jollies... Of course, we'll both have fun explaining how it is that you wound up in the emergency room, but as long as your boat gets floated, I'm sure you won't mind...

If you would look closer, you will see that there is not a VR7 in a Cobra 148
GTL or
Uniden Grant XL. It is only in the Cobra 2000 for the modulation meter amp.

And all this Swing BS is just that, BS. AM needs the carrier to get through,
the stronger
the better. Modulating the carrier 100% isthe main goal to having loud clean
audio.

Unit 824, Audioman out.

1403. Noise supression - Need basic advice

Newsgroup: rec.radio.cb
Date: 2000-08-12 00:00:00 UTC
From: scruit@nospam.yahoo.com
Message-ID: <3994a439.184048087@90.0.0.1>
Source record: 47894

Hey all,

I'm chasing a few sources of noise interferance in my cb setup in my '95 Taurus. The CB is a Uniden Grant 76, and the antenna is a thru-glass type (I can't drill the car for a permanent one)

The sources of noise are;

- Fuel Pump (2 secs of noise when key is turned to on, then constant with engine running)

- Ignition (crackling in time with the engine)

- Windshield wipers (noise only when wipers are on)

- Blower motor (only on high)

I must fix these to use the CB, because all of these can be running constantly...

Here's what I have done/tried so far...

- Put a 470 MFD capacitor between the fuel pump power and the body with cap negative to the body, about 12 inches from the fuel pump (the closest I can get) - Reduced fuel pump noise by about 1/3

- Grounded the trunk lid and hood with ground straps to body - little difference

- Grounded the fuel tank to the body (well, the fuel pump is inside it and I thought it would act as a good shield... ;-) No difference

- Put a 470 MFD between the wiper motor power wire and body, with cap negative to ground. I was able to connect to the power wire right at the motor. Absolutely no difference.

- Grounded the antenna via antenna instructions. No difference.

- Grounded the CB chassis. No difference

- Installed a 10g wire directly to the battery, routed it away from all other wiring and connected it to the CB power. I connected the CB ground to the bodywork about 3" from the CB. No difference.

- Run the cb from a spare car battery. Still got the noise just as loud.

- Installed a 470 MFD capacitor from the + on the coil to the body. The car would not start. Removed it, and the car started.

Am I hooking the cap up right? Is a 470 MFD cap from Radio shack (about the diameter of a AA battery and half as long) the right cap to use? What else should I try to eliminate this noise?

Thanks,

What's most outrageous is the Clinton Department of Justice suit
against tobacco companies. The federal government can't claim tobacco
manufacturers duped them. Since 1964, there's been a federal mandate
that cigarette packs contain warning labels. On top of that, for
years, until 1974, the federal government passed out free cigarettes
to servicemen.

The Democratic equivalent of a tax pledge this year seems to be: Read
my lips -- no new tax relief!

Source record: 47900

Hey all,

Last night I tuned my antenna and got a SWR of 1.8:1. There is some fuel pump noise, but I can live with it for a couple of days.

Now, this morning, I go out to the car and try to use the CB. The antenna light came one and I got a SWR of 3.5:1.

The car HAS NOT MOVED! The wiring HAS NOT BEEN TOUCHED!!!!
Absolutely nothing has changed (apart from the outside temperature - 50 degrees when it worked, and 75 degrees now)

This is happening a lot - this Radio Shack mag-mount antenna will switch from a good SWR to a bad SWR (with antenna light on when I hit the key) with no apparent cause, and then back just as easily...

What the heck do I do now? I about ready to just tear the whole setup out and say to hell with it.

Any advice sincerely appreciated,
Grae

Some people here where asking why a grounded base amplifier would be considered class C, and not class B. It is actually two reasons:

1. A grounded base amplifier still takes .65 to .7 volt to turn on. This means that assuming a symmetrical input, The transistor will be turned off more than it will be turned on. This is compounded by the shit signals most people feed the amp, since overmodulation means the input signal is cut off for an extended period of time. Almost like pulse feeding the input of the amp. And, since the base doesn't turn on for .7 volts of the positive voltage swing, and the 2879s can saturate with 3 to 4 volts of input, that means that 1.5 to 2 volts of the input is positive, and the same is negative. Subtract the .7 volts that the transistor is NOT ON for the drive cycle, and your transistor is now on for .8 to 1.3 volts on the input cycle. The transistor is also off for 2.2 to 2.7 volts. Look at the ratio. Unarguable class C.

2. The 2SC2879 uses ballasted emitters. This means that the emitter is actually ABOVE ground, no matter how you have it grounded. This puts the transistor into class C.

Hope this helps.

Toll Free

I know this has been said before, check the bottom of the magnet adn the car body for wetness.. This could affect the ground to the car. Just a though. Might work might not, but how ya gonna know if ya dont try it.

I'm not sure what an 'antenna light' is. Are you still playing with that glue-on antenna? If so, wait until the temp is 50 degrees again and check the swr. It will probably go back. Remember that the little thing is tuned by a capacitor, and the capacitance can change with a change in temperature.

understand
> it...
>

>>>>I read and understood perfectly.

> Modulation causes swing, an increase in power transmitted.

>>>Agreed.

Swing does not equal
> modulation.

Nope, it doesn't. It is a byproduct of the carrier shift derived from
modulating a carrier via AM.

If it did, you could check your percentage modulation based on your
> carrier power : peak swing ratio....

I can. Any REAL technician could. A modulation meter is a flippin joke.

>
> If a radio keys 2 watts and swings to 18, does that mean it's at 900%
> modulation? I don't think so.

No, it doesn't.

If a radio keys 2 watts, then it would have to do app 8 watts PEP to be 100
percent modulated, and it would also be doing 3 watts RMS. 2 keyin 3.. Not
a lot of "swing", huh?

Your 18 watts would equat to app 6 watts RMS.

With a 2 watt carrier, it needs 1.5 times the power output increase for 100
percent modulation.

Therefore 2 watts up to 3 is 100 percent.
2 watts to 4 is 200 percent
2 watts to 6 is 400 percent (Modulation index is logarithmic)

So, your 18 watts PEP swing is actually 400 percent positive carrier shift,
and not 900 percent.

>
> Maybe some of the HAM's and others who really do know what the heck
they're
> talking about could fill me in on this...

>>>Maybe when you shut your mouth, you will realize that you ARE talking with one of the ones who DOES know what they are talking about. Quit listening to the people telling you what you WANT to know, and listen to the ones who actually KNOW how a radio works.

You need to replace the cap with a one with a higher working voltage if you plan on running any amoung of power.

Also, the Wilson provides less static than the K40 by its nature of being grounded at DC.

1426. Re: Wilson 1000 vs K-40

Newsgroup: rec.radio.cb
Date: 2000-08-12 00:00:00 UTC
From: Toll Free <tollfree@bigradios.com>
Message-ID: <Nvel5.236478$t91.2283278@news4.giganews.com>
Source record: 47917

Shunt fed is a type of feedpoint matching system.

The antenna is at DC ground, but at higher than DC RF ground by virtue of the inductance in the coil of wire feeding the antenna.

Kinda like a Penetrator base antenna or the newer Maco base antenna.

And if the antenna has a gamma match (which the Wilson does NOT), then it won't be a shorted grounded antenna, either. A gamma is a LC network.. C stands for CAPACITOR.

The Wilson 1K does NOT have a capacitor in it for matching. "The Game" is once again, wrong.

The temp changes could be causing your coax to expand and contract, if it is solid center wire, you might have a break in the coax.

I hope you are planning on opening the clairifier on that too. Our SSB club used to have a sunday night net and you could tell everyone who was running the sears radio's, they were all a little low in freq from everyone else. Opening it up will eliminate that problem. Good Luck

1435. Re: This is starting to P!SS me off!!!!!!

Newsgroup: rec.radio.cb
Date: 2000-08-12 00:00:00 UTC
From: Jay in the Mojave <jay123a@qnet.com>
Message-ID: <39955450.3D4B8600@qnet.com>
Source record: 47926

Hello Greame: Your not the first guy who wanted to tear out the radio stuff and drive over it, and you ain't gonna be the last!

The antenna manufactures, book writtin guys, and a bunch of others ain't written any real good material on how to tune, trouble shoot, fix, or repair a antenna installation. So don't feel like the Long Ranger.

The thru glass antenna is a piece of junk, at CB frequencies. The only real advantage of having this type of antenna, is purposely wanting a 1 to 2 mile range while mobiling to listen the real close in local truckers, for cop and traffic alerts.

Saving you from drilling holes, removing head liners, pulling up the carpet, removing trim, and doing it right is now biting you in the a$$.

Not being there to inspect the antenna and radio installation, severely limits the guys here on the newsgroup from helping with advice. So I will offer what I can here.

First off the difference between a SWR of 1.8:1 as compared to 3.5:1 isn't a hole lot. But in a effort to get the antenna to react with a solid SWR I'd try looking at the antenna, is everything tight, is the coax connector screwed on tight, is it possibly screwed on with just one or two turns or cross threaded, and has the coax been pinched by closing the car door?

If you move the coax around a little does this make the SWR go on and off?
This may indicate a intermittent connection at the radio or antenna.

Does the SWR light come on, go out with the mic cord being moving about? If it does this may indicate the coax is not properly grounded to the vehicles body, at the antenna. This would also work with moving the coax.

I would also suggest a Wilson 1000 antenna, they have a good magnet mount antenna. Please let us know what you find wrong, or how you fix your problem.

Jay in the Mojave

Hello Toll Free: Half to agree with ya on all counts.

I bought a Wilson 1000 a few years ago, and didn't like the cheap crap coax they used with the Wilson 1K antenna. I replaced the crappy coax with bullet proof RG142B, and noticed the the Wilson 1K did not have a impedance matching capacitor, but just a series coil. So this is not a gamma match.

The Maco V5/8 and the Penetrator 500 use the same impedance matching circuit. However the MaCo V5/8 has a single point mount (approx. 6 inches)
that the vertical element is mounted into a insulator, and the insulator is mounted into the base assembly pipe, and this adds parallel capacitance which makes the antenna look electrical longer that it really is and adds loss. This is the same way the the Sigma 5/8 was designed, ain't that a coooooooisadance?

The swing mod came about when stupid golden screwdriver cb hackers went inside their radios and started to fuck things up. All AM transmitters will "SWING", it is the nature of the transmitter. But stupid cbers use peak reading watt meters, whistle into the mike and tune the fuckin radio for max swing. No longer are the days when a radio is properly tuned up with a scope, RMS meter, etc. If you listen to these fuckin idiots on the air you may notice how shitty their radios sound. "Man oh Man, look at all this swing, AAAAADDDIIIIOOOO," you might here them say. But its all shit. They sound like crap. And what makes me laugh is the fact that swing actually makes your signal harder to hear and understand. It does nothing for you. So what I am saying is that CB radio operators are stupid. They think that they know everything about transmitter operation and design. They think that they are making their radios better. But actually they are just fucking them up. You seem like a smart guy so dont get suckered into thinking that low carrier and lots and lots of swing is good. Nobody will hear you any better. In fact they will hear you worse.

Hello Geekcb,

Get a K-40 mobile antenna magmount or the fix model . You will have to drill a hole in the roof if you don't wish, stick with magmount. You dont need to by models that will handle more than your radio, it is just a market scam.

Geekcb a écrit :

> I am gonna put an antenna on the roof of my van. If it is real tall it is ok. I
> just need to know what the best antenna would be (model #, company, etc..).
> Doesn't matter how much it cost. O yeah, I will be putting about 250 watts out.

Hello,

You may have a bad altenator (defective), connect a 20 amp filter on positive leads of your radio direct on the battery this should fix it . If you still have some buzz left over connect one also on the negative lead .

later,bob

Hello Wild Bill: Nope, the Wilson is not shunt feed. It is bottem feed
with a series inductor as the matching element.

Suggest you look up shunt feed in the ARRL Antenna Book.

Jay in the Mojave

Toll Free,

I don't mean to sound condescending, but what you just said is in directo opposition to that which someone else said in another section of this thread. So apparently one of you doesn't know what you're talking about, and is making it up as they go along to look smart to the others here...

Now I don't know who to believe, because both make a certain amount of sense, and both have points with which even I could argue...

And I invite you up here to south central Michigan, to hear how my CB sounds. Bring your meter sets, too. My radios all sound crystal clear, according to what others have told me.. not muddy and scratchy, as a radio that was overmod 400% would sound...

So what's going on here?

Jay I have looked it up and still believe I am correct what is your defenition of shunt fed ? Suggest you also look it up .. and if you don't understand it ask someone who does.

"A small inductance is inserted at the base of the antenna, the loading coil inductance being reduced correspondingly to maintain resonance . The line(coax) is then tapped onto the loading coil at a point where the desired loading is obtained . The approximate inductive reactance that must be added in series with the base of the antenna and ground (across the coax line) " blah blah blah
...

You could also run out to a local truck stop and get one of those four lead power filter brick's made by DEISEL electronics... Worked for me on several setups.

Why would you replace R131 with one half the original value? All R131 is is a bleedoff resistance to ground to slow the "clipping" effect that happens when the AMC is tripped. Replacing it with one half it's original value would double the clipping effect, wouldn't it?

I have the SAMS schematics and service manual for the Cobra 148 GTL and the
Cobra 2000 GTL
and there is no such mention to a VR7 in the tune up sections nor on the
schematic diagram itself for the
148 GTL!
They all use a similiar PC board and physical layout with slight differences, so
there will be a silkscreened
VR7 label in the Cobra 148 GTL's and Uniden Grant XL's circuit boards. However,
there is no VR7
on the Cobra 148 GTL for modulation adjustment on the schematics... maybe there
are version differences?!?
Or maybe they assigned VR7 different duties in the 148 GTL as opposed to VR7 in
the Cobra 2000.

Shunt feed IS the type of feed the Wilson uses. This consists of
a coil between the ground connection and the whip. The feed
from the center conductor of the coax, is attached part way up the
grounded coil. In other words the coil shunts DC to ground.

BLY:

You're right, VR7 isn't mentioned in the SAMS for the 148... but the components ARE on the board. Other manuals show VR7 in these radios to be the AMC control

But in all 3 of my 148's and both of my Grant XL's, VR7 is on the board, and changes the AMC, which affects the modulation percentage.

Graeme,
I think everyone's covered most of the 'biggies', so lets step back a minute and make sure of some of the little things.
When your tuning an antenna you want to be away from anything near the antenna/vehicle. (The middle of an empty parking-lot is good.) You want to keep things the same for each check, if you have a door open on one SWR check, keep it open on the subsiquent checks (better to close the door for all checks). Try to keep the conditions the same.
Only change one thing at a time. It takes longer but in the long run it makes things much simpler(you'll know what ~did~ make the difference).
Now some specifics. Make sure that a 'ground' really is a ground, and that all grounds are really connected together. It's a ~lot~ of trouble but, running a strat, starting at the hood, down through the engine compartment, under the car to the back bumper. make connections all along the strap (recomended by Ford Mfg, if you can believe that). 'Cover' the computer harness with torroids! In extreme cases (if possible) make a Faraday Cage to cover the CPU.
If you can, borrow various 'parts' of your system for substitution.
Probably the easiest way to check an antenna is to try another one. Same for SWR meter, and radio. Feed line if a little harder, but do it if you can.
And as a last resort, there's a procedure that always works, but is a bit dangerous. Take all your clothes off, paint your self blue, and dance around the car. The more people you can talk into helping you do this, the more effective the procedure... especially if they're female...

My name is David and I am the sales manager of the largest Export Radio site on the net. One of my hobbies is to talk on and about radios. I've always enjoyed tinkering with radios and like to give advise on how to fix common problems. One of my good friends is a technician at my company and has helped design radios for some of the major manufactures of exports. I'm always asking him stupid questions and he is always giving me in depth answers. He has taught me a lot about radios, but I still want to learn more. If you have a technical question, I would enjoy trying to help you with it. If I can't give an answer, it will just give me a chance to make my tech friend think real hard. I've tried this on other forums and the response was great. Also, if you have some advise about a technical issue, post it. Maybe someone can learn from you also.

David

I would just like to say that I really appreciate technicians putting mod kits inside of radios. The retail store that my company owns gets paid a lot of money for removing them from radios. My favorite mod kits are the ones that are put inside Galaxy's and Connex's. Man, do these little mod kits screw up great radios! My purpose for writing this response is to challenge you guys to open up a mod kit. Yes, cut through the epoxy and look at what is inside. Once you see what is here, I will be happy to sell anyone a capacitor and a diode for the $25 and up that these guys sell them for.

1475. Re: Wilson 1000 vs K-40

Newsgroup: rec.radio.cb
Date: 2000-08-12 00:00:00 UTC
From: Jay in the Mojave <jay123a@qnet.com>
Message-ID: <3995BF60.F44E936A@qnet.com>
Source record: 47966

Hello Wild Bill: I stand corrected on the Wilson 1000 impedance matching coil, it is not just a series coil, but a tapped bottom loaded vertical.

However this is "NOT" what is called shunt feed in the antenna community. The impedance matching, tapped coil is simple a inductive impedance matching device. Shunt feed vertical antennas, are grounded vertical antennas that are feed at a short distance from the bottom of the antenna, physically attached to the antenna.

You can call it what you want, but if your asked what a shut feed antenna is, in a job interview, don't tell em what you think it is.

None of antennas that use the parallel input inductance and series inductance are called shunt feed. This is called a inductive, or inductive "L", or auto transformer type impedance matching transformer.

Another thing to consider is that in the electronics and communication fields, there is not a dead nuts definition of terms that will apply to everything being the called the same. I have worked at companies that call all kinds of things wrong, as compared to what the ham and CB guys will call things, because of some college graduate, goof ball, nut cake, half to have everything spelled right, bed wetting, butter fly chasing, communist, dick wad, self righteous, no hands on, book worm, mommas boy, follow the all the rules, alternate life style, Bozo, done for the day if the break a nail, ass hole, is the lead engineer. But they half to get back into their hole when customer documents have to be written, and test reports explained. I love the smell of money and reality in the morning, and evening.

And other companies have whatever it takes to make things work attitude, this works the best. Mis spelling in technical documents is also a plus.

I think you did a great job looking up the definition, but it doesn't say "Shunt Feed" anywhere, but I took it as your definition, as shunt feed.

Have a good weekend. Hope your not mad at me, for disagreein, and if ya see me at a break you can buy me a beer, ah?

Jay at jay123a@qnet.com In the Great Mojave Desert, ... Just down the road ah ways from the fillin station.

Miss Dinah down at he fillin station says: "U CB type of guys don't leave your empties all over the place, and stop sayin I need a man to settle me down, over the CB." ....Yeah!

The lightning arrestor thing is usually only a spark gap and will not ground
it. It only make a path for an large arc coming down the center conductor of
the coax for some lightning protection.

Well, call me confused. Grounded base (grounded grid, grounded gate) - to me - implies the base, grid, whatever, is at SIGNAL ground. Zero bias implies something else. A grounded grid amp simply means the signal to be amplified is fed into the cathode circuit. There are a bunch of ways to amplify a signal. The voltage gain, impedance, frequency response, and many other things will vary depending upon where the signal is fed and from where the signal is taken. You may feed the signal into the base and take the output from the emitter. This is an emitter follower. Voltage gain is less than one. Current gain it high. Feed the signal into the base and take the signal from the collector and you have voltage gain. Current gain is much less. The whole thing boils down to this: zero bias is one thing. Grounded whatever implies that the whatever is at SIGNAL ground, not necessarily at DC ground. You can still have bias (hmmm ... bypass caps). Come to think of it, you can have enhancement mode and depletion mode IGFETS. How many configurations .... heck I've gotta take off my shoes and socks to count!

>de Galaxy's and
>Connex's. Man, do these little mod kits screw up great radios!

Sounds like a Dave or Debby post..I`m sure if you were to go to the techs at Galaxy and ask them they`d tell you the radio`s were like they are because of FCC regs on their output.If you were to tell them the FCC had done away with the output regulations they`d make some of the same changes to the radio any GOOD tech is now doing..Those so called "Mod Kits" you refer to are for do it yourselfers who don`t know how to do the follow up realignment and tuning needed after these changes..In the mean time just keep ripping off your customers removing these parts rather than realigning and tuning the radios for them

The internet is more than a global pornography network

in the antenna
> You can call it what you want, but if your asked what a shut feed
> antenna is, in a job interview, don't tell em what you think it is.
==========
Well Jay i would have to say the antenna community does call it this since
there is a diagram of this antenna in a older arrl antenna book and yes it
is called shunt feed mobile antenna. I have also heard other knowledgable
antenna people describe this antenna this same way

> I think you did a great job looking up the definition, but it doesn't
> say "Shunt Feed" anywhere, but I took it as your definition, as shunt
> feed.
==========
yes it took me a bit of searching since most new books dont describe shunt
feed mobile antennas. i took that excerpt out of an arrl book and the i did
leave out the beginning which was a diagram/schematic showing a antenna
that could be the wilson 1000 and the description i posted was on shunt
feeding a mobile antenna... All the newer books did not have much on shunt
feeding mobile antennas. why should i be mad at you for disagreeing this is
how we learn when someone disagrees we search for the correct answer and
hopefully everyone learns something they didnt know ... Stay cool out in the
desert

A 1/2 wave is 0dbd and 2.1dbi. I could not remember if a Starduster was 1/4 or 5/8. That is pretty bad since I used to have one.

1500. Re: Mobile Power Through Cig Lighter

Newsgroup: rec.radio.cb
Date: 2000-08-13 00:00:00 UTC
From: 'Doc <w5lz@oio.net>
Message-ID: <39965138.73F229D9@oio.net>
Source record: 47991

Nick,
It's a matter of how much power (amps) you can draw through the cig.lighter. That's a matter of how large the wiring is, and the size of the fuse for the receptical. Most radios shouldn't be a problem, but once you get above 7 - 10 amps(?), you'll pop the fuse. I don't know how much an export radio draws, or the amplifier, but I'm willing to bet that it will be more than the cig-lighter will provide safely.
'Doc

1503. Re: Amp in semi-truck question

Newsgroup: rec.radio.cb
Date: 2000-08-13 00:00:00 UTC
From: Bill Nelson <billn@spock.peak.org>
Message-ID: <8n5k86si5@bashir.peak.org>
Source record: 47994

```
: X-Force XT400..(2) driving (4) amp..In my co-workers truck when he keys
: it shuts the truck off..The amp has a good frame ground..
: My friend is using a President George for a radio, and a Skip Shooter 5'
: antenna..I put his amp in my truck and it works fine with my Connex
: radio..Put his amp back in his truck and used my Connex as the keying
: radio..I can deadkey and truck will not shut off..But as soon as I say
: Audio, the truck misses, but does not die..Is this a ground
: problem??Weak batteries or alternator??Both trucks are the same except
: mine is one year newer..Any help wold be greatly appreciated...

These are classic symptoms of rf currents from your rig affecting the
truck's computer.

There are a few steps you can take.

1) try moving he coax further away from the computer module.
2) eliminate rf currents on the outside of the coax, which are the
probable (but not only possible) cause of the problem.
3) properly bypass all the computer leads to block any rf. It is
also possible that the rf is interfering with one of the sensors, so
that may also have to be checked.

Hello Professor: How do ya figure that!!!!?????

I got my "I am a 11 Meter Puke" ball cap, gets lots of looks at the TRW swap meet.
I got my "Blues Brothers Ray Ban" Sun glasses,
I got my dirty old favorite shirt the X tried to throw away in 79,
I got my "Kiss me F@#$ me shorts,
I got my dirty stained white socks,
I got my new old tennie runnies from 1992
I got my cold cold beer
I got me my favorite rockin & swinging chair on the front porch, shoot a lot of desert rabbits while ah swinging. It takes practice.
I got me 93.1 MHz FM from Los Angles, blastin over classic Rock & Roll over my Electro Voice Premium Theater Gold Star outside speakers
I got my girlfriend coming over to cook fer me
I got my 64 Buick, with duel 102 inch stainless steel whips
I got it all.

I even know the what PEP and RMS is, and what the difference in gain a 1/4 and 1/2 wavelength antennas R.

I may not be very well off like Hillbilly is with ah new gun, fine clothes, nice cabin, and some squizzin sprits, but I do OK.

Jay in the Mojave, 112 degrees today.

Which ones are you looking at? The critical rating for a tuner
is it's power rating. Also remember that most tuners are rated
in PEP, so get twice as much as you need in the power rating.

Just for the record, I've got access to a network/impedance
analyzer (school equipment). I've checked the initial antenna impedance,
and it resonates at slightly under 26 MHz (thus the 2 extra inches). I
can't *really* check it with this equipment though because I can't take it
out to the car for installation. It showed up as a very large resistance
value at resonance though (>500 Ohm). Perhaps this was because of a lack
of radiation with the indoor test facility? I wouldn't think I'd need a
balun for this arrangement since the normal fiberglass sticks don't use
one and can manage a descent VSWR.

Radio Checks are issued Monday thru Friday from 6 PM to 9 PM by appointment
only.
If you'd like to set an appointment, please call 1-800-555-5656.
When the bitch answers the phone, give her your name, your CB handle, Make and
Model of your radio, your mailing address, and a credit card number.
When I get in the office, the bitch will give me the message, and I will
promptly issue you your Radio Check freshly wiped from the crack of my ass!

This message was brought to you by Kotex.
"We're not #1, but we're up there!"

Ain't that the truth.

The morons that have "come up" on the radio these days just don't have a clue.

MRF454s ruled the amp scene, for a long time.

Now you talk about MRF454s, and most of them ain't ever heard of them!

What I am saying is that when a cb'er hears a loud, distorted, clipping, raspy, overmodulated signal they think it sounds good. You know its true, you can't deny that. And this is exactly what these "SWING" mods do. It's not doing anything for you. Man you people are thick headed. It seems that all you people are only concerned with how much bleedover you can create and how many people you can annoy. This is extremely childish behavior. Grow up. Act like an adult. I know you can!

As far as my name goes, so what! Are you 10 years old? Or are you just a 40 year old with a 10 year old mind. I don't think that a name has anything to do with what we are talking about.

So every radio that swings sounds like crap? Interesting....

I've got some radios that really swing like the dickens. I've also had some HAM operators who are also CB'ers tell me my radios sound very "HF", "Clean", and "Clear".

So I ask you... is every radio that swings from 2 to 18 watts (for example) a dirty splatterbox? Not ALL CB'ers think clipped, distorted, muddy audio sounds "good"... I'm one that doesn't.

Just because one runs a CB does NOT mean he doesn't know what sounds good.

Just my two cents.

remove the obvious to reply.

1531. Output impedance adjustment?

Newsgroup: rec.radio.cb
Date: 2000-08-13 00:00:00 UTC
From: Cory Papenfuss <papenfus@juneau.ece.uiuc.edu>
Message-ID: <1ZDl5.727$9N1.12679@vixen.cso.uiuc.edu>
Source record: 48064

Another quick question. The radio I'm using is a cheezy Cobra 20Plus that has a pseudo-SWR indicator on the front. It's not a real meter, but rather an LED-bar that basically has three states. It will show 1, 9, and +30 SWR. It almost always shows up in the red (+30) no matter what the load is. I've used a couple of dummy loads that are exactly 50 Ohms (checked with network analyzer). Is the output impedance of this thing off, or just a crap indicator meter?

Thanks
-Cory

Um... That's not an SWR meter... It's a receive meter, which is probably set to trip all the LED's when you're transmitting.

Use a real SWR meter to check the SWR of your antenna, and adjust if necessary.

>So every radio that swings sounds like crap? Interesting....

No, It is the nature of an AM transmitter to have "swing" or "upward modulation" but, I am not talking about the 2-3 watts upward that is ok. I am talking about this 2-18 watt crap. How are you measuring this? RMS, Peak to Peak, what??? If a radio swings 2-18 it WILL splatter, no question about it. But the amount of splatter depends on signal levels, receiver design etc.

>I've also had some HAM
>operators who are also CB'ers tell me my radios sound very "HF"

What is this supposed to mean. Sound HF??? Last time I checked HF meant high frequency and designates the portion of the spectrum where the cb band and many ham bands are located. HUH? Also I would like to let you know that getting a ham license is like getting a drivers license. It requires no special skills, just good memorization skills. So the fact that a ham told you this doesn't impress, or surprise me at all.

>Just because one runs a CB does NOT mean he doesn't know what sounds good.

Yes I agree with this, but may I ask you where you are from. Here, in Vermont, every operator runs radios like this. They also think that they know what they are doing, then screw up perfectly good radios. I hate that!

The origional question asked about swing kits. What are they, etc. To this I reply: A total waste of money, time, and effort.

I just love how every question posted to this group turns into an opinion war with people throwing stupid insults at one anothjer. I understand the idea that all of these posts are pretty much opinions, but get real people. Nobody cares whether you think your rig is better than another's because of the way it's tuned. Also, I personally don't appreciate the statement that all CBers are stupid and we don't know what sounds good. I've heard people on $500 radios that sound like trash, and I've heard $2 flea market specials that sound wonderful. If it sounds good, it sounds good. That's it, end of story.

>
> -Cory

Cory,
If I'm reading your post correctly, and it seems resonant at
26 Mhz, then don't add wire, remove it. If your resonance point
is too low in frequency, remove length. If it's too high in
frequency, then add to the length
There's no need for a balun. The 'normal' input impedance for
a 1/4 wave radiator with a ground is probably around 15 to 30 ohms.
That will result in a SWR somewhere between about a 1.5:1 to about
3:1. One easy matching system to make is a 'matching' coil at the
base of the antenna. One end of the coil is connected to the feed
point, and a 'shorting lead comming from ground, going to various
'taps' on the coil. You can also use a capacitive match which
should be 'better'(less resistive losses), although there's really
not much difference as far as what you can 'hear'.
Good luck...

Cory,
No, it's not off, and it's doing what it's supposed to do. The
meter isn't an SWR meter, it shows a relative output. If the SWR,
or impedance match is not good, the meter will read lower.

If you located resonance at 26 MHz and it is greater than 500 ohms at the feed point(I assume 500 is the max your equipment will read) It sounds like the antenna is resonating at 1/2 wavelength instead of a 1/4 wavelength. !/2 wavelength resonance points will have a high impedance and odd 1/4 wl resonance points will be low impedance. As I am sure you know, and your instuctor can verify, a coiled wire has a lot more inductance than a straight one so you will need a lot less wire than 104 inches. Check for resonace again down around 13 Mhz, you should find it again this time at a much lower impedance. Since you have the equipment I would check it for resonance using the total range of the test equipment you have. Yo umay be suprised at how many points of resonance there are. Your deductions about not needing a balun are correct. The feed point impedance should be around 30 ohms.
The indoor testing should not effect the readings that much allthough you can expect some changes when you mount it on your car. I would trim it a little long, say cut it for 26.5 at a low impedance point then you can do the final trim on your car with just an SWR meter. You do have the option of making it even longer than it is now to resonate it., this will make the antenna 3/4 wavelength long at its next low impedance resonant point. Several antenna makers do this because it allows them to advertise there antenna as 5/8 or 3/4 wavelength antennas. All the extra wire does is add extra loss.

I use one too. I have a Vectronics 300DLP or something like that. It is a decent tuner but I would get something better next time. It works well with a longwire that I have (it is not that long) and I have been able to talk all over the place with 50 watts.

1570. req, looking for dualband vhf/uhf extendet freq.

Newsgroup: rec.radio.cb
Date: 2000-08-13 00:00:00 UTC
From: Remco van de Sanden <rvandesanden@home.nl>
Message-ID: <Yfvl5.5354$a7.2025061@news1.dbsch1.nb.nl.home.com>
Source record: 48103

Hy i'm looking for a handheld port. with a big freq. range. Tx and rx. I'm located in the Netherlands so we can listen to every band.
So who knows wich unit has the biggest freq. range in tx/rx (modefied) kenwood,icom, standaart etc.etc.
And what would the cost of such a radio be in the US, or does anyone know a good online-store.

Thank you.

He was referring to a bias condition where the base or gate is at "DC
ground"...
You are using the words "grounded" and "common" interchangably. Toll is not
talking about a "common base" amplifier.

They are getting it because they are playing a trick no doubt. They are probably not making reference to what it's +7dB from... certainly not a 1/4 wave ground plane.

Hello Wild Bill: I have shunt feed a few towers for lower frequency HF work. After trying to tune the damn things, you know what shunt feed is all about.

Had to use a 100 foot tower in a pinch once. It was grounded, and I shunt feed the tower (at about 20 to 30 foot level) as described in Capt Pauls Vertical Antenna Handbook, it worked great, but I have never worked at anything so long. It would have been easier to install a HF antenna on the tower.

Once it was tuned and going, it worked great. Could hear all kinds of HF stuff, but never any CB or 10 meter skip.

Hello Hamm 4 fun: I bought one (a Italian copy) to compare it with other CB Base antennas. Its cheap shit junk, and the parts are stamped together, the vertical element has a stamped piece to it, that is loose as a goose out of the box.

I decided not to mess with it. I gave it to one of the locals kids, but he didn't want either. Swing by the desert shack and I'll make ya a good deal.

Its a 1/4 wavelength ground plane antenna, with the ground plane radials, are not where they belong, in the flat and level position. They have dropped down the ground plane radials to help match the antennas SWR, at the cost of grater interference to neighbors TV's and Phones.

I haven't measured the antennas gain, but I would guess around -1 to -2 dBd.

Jay in the Mojave

1582. Home-brew helical whip matching

Newsgroup: rec.radio.cb
Date: 2000-08-13 00:00:00 UTC
From: Cory Papenfuss <papenfus@juneau.ece.uiuc.edu>
Message-ID: <hKyl5.718$9N1.12530@vixen.cso.uiuc.edu>
Source record: 48115

Hello all. I'm trying to build an antenna out of a 5' 3/8"
fiberglass rod. Since it's short, I wound 104" of 14 guage around it
until it was all on there. As far as matching it, is some sort of balun
necessary on the feedpoint, or can the coax just be connected directly to
the whip? I'm figuring on trimming the length until it matches, but I
want to make sure that it'll even be close.
BTW, I've installed it alongside the hood of a hatchback car to
use (at least one side of) the hood as the reflective ground plane. Any
comments?

Thanks,
-Cory

What you're trying to do... without some sophisticated equipment (network impedance analyzer) is very difficult. If you do make it work... you have done well!

It's going to take much more than 104 inches of wire. Start with 140
inches. This should be close.

1585. Power Tweak, TRC-427 Yes, it's old.

I know it's an old radio, but it's all I have. I was just wondering if I could get some schematics on it, or just some sort of help with increasing the watts, some sort of tweak or mod that I could do myself?

Thanks for reading this,
Christopher

You guys are always huffing about the antenna gains quoted by antenna manufactures. They all puff about their products, what do you expect? Marketing guys are just not normal and their ideas are always bigger than life. If you don't have two or more antennas up and working then you can't even make a comparison.

The SD'r has always been a good performer and the Italian made model is likely just as good as the old Antenna Specialists. It is better in some respects, though limited, they are still being made and are still available new.

The big thing about this antenna is that it works as a 1/4 wave vertical ground plane for you "ground plane guys" and it appears as a vertical 1/2 wave dipole with a near 50 ohm imput "to mother nature."

The angle of the ground side radials and the supporting pipe insulation of the coax from the radiating field allows direct feeding of the antenna with a near perfect match. This makes the antenna very quite on RX and very efficient on TX.

RF Power Meter = VR4
S meter = VR3
Squelch = VR2
TX Freq = VC1

Of course, this doesn't take the place of a real tune-up, but you can at least
get the radio legal with it...

Source record: 48121

Hello all, I am selling all of my radio and test equipment. Here is
the list:

1. One RCI 2970 10-12 Meter radio; 50W AM/FM/CW 100W SSB $225
With EC 2018 Road Noise Turbo microphone Included with radio
2. One Texas Star 1200 amplifier AM and
SSB SOLD
3. One Workman 2K Low Pass
filter SOLD
4. One 24VDC 1.5F
capacitor
SOLD
5. Two Radio Shack external
speakers $5 ea
6. One Super Penetrator mobile
antenna $20
With One 6" spring included with antenna
7. One 3 pad magnetic mount with 14' of RG8U 95%
shielded $20
8. One DAIWA Cross-Needle power/SWR meter 2KW max range $100
9. One Radio Shack 3A power
supply $25
10. One Radio Shack Frequency
counter SOLD
11. One 300 W MFJ 260C dummy
load SOLD
12. One 1.5KW MFJ 264 dummy
load $40
13. One 60A DAIWA power
supply $150
14. Assorted electronic parts in storage drawer
cabinet SOLD

All equipment is like new, REALLY. I take care of my equipment. The
radio is months old.

John

P.S. I also have a 100MHz O'scope that sometimes works and sometimes
doesn't. It looks like a power supply problem that I was too lazy to
fix and now it doesn't really matter. It is a Textronix with all
manuals. Make me an offer if interested but it will probably cost more
to ship than you may be willing to pay.

1589. Re: Best Handheld CB's?

I would recommend getting something other than a 11 meter CB, if you need good handheld communications. Just like on a base or mobile, you are going to get TONS of QRM, and will not have much power to punch your signal through.

You can get the new FM VHF/UHF handhelds now without a license, and they are getting cheaper. Even big discount stores are starting to carry them.

Later,

Agreed... once you cut through the marketing hype... the Starduster is a
very good antenna from several respects. First... it has pretty good gain...
I would estimate a real figure at maybe +5dB over a 1/4 wave ground plane.
Second... it's physical shape allows it to be rather robust... therefor
surviving the evil wind that takes it toll on so many aerials.

104 inches is already too much but should be a decent starting point.You would not want to start with too little. All you need is an SWR meter and some wire cutters. I would suggest that you try a known properly setup antenna in place of the one you are trying to build first. This will let you know that every thing else is set up OK. If you start out with bad coax or ground connections to start with you never get where you are trying to go. You can be pretty safe cutting off about an inch at a time. Check the SWR after each trim checking it in several channels so you get and SWR curve or graph. The lowest SWR will not be 1:1 on this kind of antenna, probably about 1.5:1 may be the best you can expect. What you are looking for is the bottom of the SWR curve to be in the middle of the band. If you know some one who has something like one of the MFJ antenna analyzers invite them over. . It would be a great help to know what the inital resonant freq is.This just makes it a little easier though, you really dont ned it I've built several antennas like this including using some cane poles for support. I wanted a real fishing pole antenna.Good luck and have fun.

Heh .. no. I talked with an electrician two days later. They simply take the wire size necessary for the load and drop one size per hundred feed of run. We had 200 to 250 feet - 1 way. This calculates to 400 to 500 feet of wire. Starting with 10 ga, drop 4 sizes for 400 + feet. 8, 6, 4, and 2. Simple and it worked. I did not have that knowlege and had wire gauge tables, but no resistance tables. I looked up the resistance of annealed copper and calculated the resistance for different wire sizes. 4 ga would have given us 5% regulation and 2 ga would give us 2.5% regulation (based upon 120 VAC supply and 30 amp varying load). I informed the owner of this - also explaining this was 'approximate'. I talked to him on a Saturday - he called me Monday and said my answer was exact. Not bad for being out of school 30 years! Ohhh .. my head hurt!

Hmmm, lets see, if a signal looks good on the scope then it sounds good on the air. The problem with cb'ers is that they have never actually heard a clean sounding radio. What they think is clean is actually distorted. Sure, a little bit of audio compression and "slight" overmodulation can help you slightly in the distance. But face it most cb'ers arent talking to people in the distance 100% of the time.

Stop screwing with your radios, you DON'T know what you are doing if you are coming out with comments like"Yeah have fun doing all that junk just so your signal LOOKS good on a scope" Pick up a physics book for God sakes.

Hi,
You might get a K40 antenna and mount it on your trunk, be sure and ground the trunk with some grounding jumpers also ground the doors and hood and the case of the radio, that should do it.
You should get a 1to1 match with the K40.....

That's right. To little would be the resonant length (108 inches)

Any time you physically shorten a 1/4 wave antenna you have to
increase the conductor (wire) length considerably. Because of
this 104 inches is way to short.

Hi,
I found the radio has a lot to do with it. The GrantXL works real well for noise reduction of outside noise and putting the antenna as far away from the hood as possible helps.

I have for sale and am open to offers, the following :

TS530-sp H.F. Trx In Mint condx/as new, fitted with narrow CW and SSB
filters. Boxed, even with original sales slip !! Coming with MC43s
Microphone and MJ-84 8-Pin to 4-Pin adapter. Spare Valves etc etc. OIRO £400

AT230 Matching ATU for the above, also in mint condx/as new, Boxed etc etc.
OIRO £85

SP230 Matching Speaker for the above line up, again Mint condx/as new,
Boxed etc etc. OIRO £30

VFO120 External VFO that works with the above, again mint/as New, Boxed etc
etc A great addition to the line-up.
OIRO £40

Kenwood LF30A: 30 MHz cut off Low pass filter. 1Kw capacity. Mint/boxed etc
etc (A must to be Legal !!) OIRO £20

Diawa NS660p SWR Bridge. 1.8-150 MHz 1.5Kw cross needle with peak hold (SSB)
Mint/boxed etc. OIRO £45

2Metre 5/8 Mobile Whip Antenna, No mount !! Loaded at the bottom with SO239
fitting. £10 (No offers !!)

And off topic, but perhaps you might want to take a photo of your new
items......
Praktica BC1 SLR camera, with 70-210 zoom lens and 2X converter...(All Mint)
Open to offers...????

All plus P+P or buyer inspects/collects.

*OIRO = Offers in the region of.....

They work very well and can handle 2 or 3 hundred watts if the mismatch is not to great. Matching 50 to 75 will be a piece of cake.

Just on a side note.... There is a very good book written by Joseph J. Carr called "The Practical Antenna Handbook" that does include sections on such topics as "trouble shooting", theory, how to install, how not to install, what applications work good, better, and optimal, how to build simple antennas to advanced, etc,etc,etc. Its a little expensive for a book, but it is worth every penny. It is written in very plain and easy to understand english that even the novice can comprehend. I learned more about antennas with this book than all the tweakers combined from the local truck stop have tried to teach me! Below I included a link to Amazon.com's page for the book. Have a great day!

I came by an old Bandit II amp that someone had tore down for parts. The guy swears it is all there. I am not totally unfamiliar with this amp and think he may be right. Mostly what I am triyng to do is get the inverter type power supply working. I am not going to use it for an amp but think I can build some mobile tube equipment around the power supply. OK what I am thinking of is a couple of plate modulated 6146s. I would really appreciate a schematic on this amp.

Hey Doc, From the high input impedance he measured(>500) he must be resonant at
a .5 wavelength node. He Needs to take off a lot of wire.

1626. Hi SWR on Wilson 5000 but Firestick OK

Newsgroup: rec.radio.cb
Date: 2000-08-14 00:00:00 UTC
From: notdareal@aol.com
Message-ID: <20000813223335.00641.00002209@ng-cg1.aol.com>
Source record: 48017

This is killing me. I have my antenna mount on the roof of my van (More towards the front). When I put a Wilson 5000, the SWR is way high, no matter how much I tune it. Next I tried the smaller Wilson 2000, same thing, hi SWR. Now, I tried a 5 foot Firestick, and bingo, flat SWR. Both Wilsons that I tried were the ones with center loaded and long bottom shaft. A local guy mentioned that the coil may be too close to the roof of the antenna and causing the SWR to be high. I don't know. I thought Wilson was supposed to be a kick ass antenna and that the roof mount would be the ideal mount. Especially on a van. Help me. Thanks.

Run the power wire through the fire wall, straight to the battery. Make sure you have a 5 amp fuse in-line with the power wire to the battery. Ground the ground wire as short as possible, like a seat bolt post or something. I used to have a Taurus myself and this is how I had my radio setup and had no problems. This should fix your problem.
I would also recommend a better grade antenna just for the heck of it. If you are just going to run barefoot, get the Wilson "Little Wil" antenna. You can get it from Copper for $30. A very good performer and isn't very tall so you don't have to be annoyed about hitting everything you drive under.
Take care

Wilson had trouble with the base loaded 1000 and 5000 on large surfaces like vans and offered a slightly longer whip. Is your antenna reading short or long?

No need. CitySlicker is correct.

The cheap ones have an open air spark gap - the better and more expensive
devices use a gas discharge tube.

I'm looking for an old tube amp that will do around 300 watts RMS. One that has a decent pre-amp would be nice, but not neccesary. I'd like to find one with strong matched tubes that also has an SSB switch. I have a little single tube (6BQ5) modulator now that will swing about 30 RMS and if possible, I'd like to use it as a driver. If anyone has something like this that they are willing to part with, please email with details. Thanks!

Ok...

That radio won't key 10 watts and sound good.... you'd do best to keep the deadkey at 4 watts, open the AMC up a bit until it's near 100% modulation, and leave it there.

Are these radio's to be used as base stations, or what? If so, you shouldn't have any trouble talking 20 miles with a decent antenna at each end...

Rule of thumb, you'll get more bang for your buck by spending a little time on your antenna system than you will bumping the radio up past its designed specs.

Most CB's were intended to key 4 and swing to about 16 watts, give or take a few at the top of the swing. If you're having trouble talking base station to base station only 20 miles apart, tune the radio to legal specs, and work on your antenna system.

20 miles on a mobile, running legal, on a normal (noisy) night is quite a feat. Quiet nights shouldn't be too much of a problem, though.

There is no substitute for taking the radios in to a qualified technician who will put it on a scope, tune it properly, and not charge you an arm or a leg, especially if you don't know what you're doing yourself inside a radio. That would ultimately be your best bet.

HTH.

In short, when I asked what they meant by that, (yes, it confused me at first, too) they said it sounded like a decent (not great, decent) quality HF rig that was suitable for HAM's. So basically, they were saying I sounded like a decently tuned Kenwood, or ICOM... I say LIKE, because there's no way a Cobra 148/2000 or a Grant XL is going to sound THAT good, but if it sounded half that good, I guess I knew what I was doing...

As for the 2-18, I was measuring Peak watts... RMS it's more like 2-10, maybe 12. I'm not sure, I don't have an RMS meter, nor, to my knowledge, has the radio ever been put on one.

1641. Homebrew dipole (somewhat of a long post)

Newsgroup: rec.radio.cb
Date: 2000-08-14 00:00:00 UTC
From: sideband <sideband@cac.net>
Message-ID: <3997AD1A.A408330C@cac.net>
Source record: 48032
Cross-posted to: rec.radio.cb,rec.radio.amateur.antenna

Got a few questions for the antenna gurus.

I'm thinking about building a wire type dipole in the apartment, which should have its center resonance somewhere close to 27.385, but I have a few questions first, before I invest any time in it.

1. Is it illegal for a CB'er (I'm not a HAM...yet) to build his own antenna?
2. Suppose I want the dipole to be able to handle up to 200 watts (I'm giving myself some serious room here, overbuilding if you will)? What guage wire should I use to make the transmitting and "ground" elements?
3. What wavelength should I try to build the antenna? I've got about 30 feet total to play with here. 1/4 wave each side would equate to roughly 18 feet. 3/8 each side would come out to around 27 feet. What wavelength would resonate the best, and have the best "ears" for my application?
4. If I build it, for example, 1/4 wave each side, is that a 1/2 wave dipole, or a 1/4 wave dipole? Technically speaking, that is. I don't want to tell people I've got the wrong thing.

What I'm planning on doing is setting a pully at the corner of the eaves on one corner of the building, and holding the antenna up there with fishingline from the top, and pulling it tight from the bottom the same way. This way I'll be able to put the antenna up and take it down easily to tune it, etc. I was going to run the coax out to a powerstrip (the type with the screws in it to mount power cables with crimp ends n them), support it with another length of fishing line, and center it on the edge of the building. Then run the radiating element and the ground element off the respective screw lugs , supporting them top and bottom with other lengths of fishing line. The antenna will be roughly four feet from the corner of the building.

Is this setup feasable? Or would I be wasting my time?

Thanks in advance.

No, it is not illegal to build your own

at least 2 gauge cable min.

the formula is 468/F(Mhz) = L(ft) so 468/27.385 = 17' 1" for a half wave dipole. divide it by 2 and that is your 1/4 wave antenna. one side is the center of the coax the other side is the shield. normally 8ft 6" on each side of a dipole tuned for 27.205. just remember that the higher you go in frequency the shorter the antenna becomes.

>4. If I build it, for example, 1/4 wave each side, is that a 1/2 wave

I would use nylon rope for the antenna mounting and not fishing line. make sure the rope is UV resistant and also seal your connections with dielectric silicone.

Brad:

Thanks for the swift reply..

Your suggestion of 2 guage cable brought up another couple of questions....
Could I substitute some steel conduit for the 2 guage cable? It would be
signifigantly less expensive. In this case, I could go with 1/2" OD conduit,
and some 3/4 OD to go over the ends, tapping and drilling a hole or two for
setscrews to make the antenna easier to match in this setup. Would that be
able to handle the power in question, or would it not be worth my time?

What guage cable/wire to use for 150 watts? 100 watts?

Thanks in advance, again.

Well, then your best bet would be to look at the efficiency of your antennas, and take both radios to a good, reputable tech for a good solid tune up.

Remember that buildings, trees, hills, etc will interfere with reception, so if there's alot of those between you there's not much that really can be done, short of putting a linear on each vehicle, in which case it would be a good idea to study and get your HAM license...

Yes... if people get mad.. they may decide to just stop such discussion.
I am sure you have noticed... I only pop up here being an irritant when
FRS is discussed an a bad way.....If you all discuss 27 Mhz... I stay
away.... that is your territory...

FYI: With the just authorized Multi Use Radio Service (MURS) this
allows the old VHF business band a license free communications
system.... MORE power.... MORE range, even external antennas....
(probably.. even though regulations aren't out yet)

At any rate.... My irritating posts are done and over.... I will leave
everyone in peace, although I will post an article referring to the new
MURS service for everyone;s general info.

After all.. I am in favor of piplic license free communications... I
just like it to be done responsibly and legally, to allow all to enjoy
the service.

Sent via Deja.com http://www.deja.com/
Before you buy.

For those interested in the new Multi Use Radio Service (MURS) that allows license free use of the former VHF "dot frequency" business band radios, please subscribe via URL below:

http://www.egroups.com/subscribe/murs

This service will go into effect 30 days after the FCC order is published in the federal register. This service will be a subpart of the CB radio service.

As such regulations are not as yet published, but info will be relayed to the list.

It is anticipated power limits could exceed that of FRS and 27 Mhz CB. Also external antennas are possible.

I guess the question here would be, did the antenna radiate as efficiently at 1500 watts as it did at, say, 10 watts? Or doesn't the guage of the antenna wire matter in reference to the power output the antenna is expected to radiate?

2 ga wire is a bit overkill and expensive.... 10 - 16 ga. will
work just fine...don't expect to see any gain. if there is any
it will be on paper (math) and the human ear won't detect it.
you can change the impedance by raising or lowering the ends of
the dipole. if its for CB then the more vertical it is the
better.

2 guage would really be over Kill Here.. indoors 16 or 14 guage would be
fine at your power level, even 18 ga would work no problem.

> >3. What wavelength should I try to build the antenna? I've got about 30

Could you kindly share your experience with me?
Does anyone have experience with Rayovac Renewal Rechargeable Alkalines batteries?

They are beind sold at auction. It looks like a good deal!
http://page.auctions.yahoo.com/auction/36893805

I look forward to hearing from you. Thank you.

I have to side with Steve on this one.
I ship items UPS & FEDEX on a daily basis.
Both have lost packages and destroyed packages.
They have lost next day packages and regular packages.
In the fall of 98, they lost an entire multiple item shipment going to the same address, which was only a couple hours from here. Some of it turned up a few weeks later, some of it was lost forever. If I remember correctly we lost almost $4000.00 worth of electrical equipment. Shit happens. Insure your stuff.
Just my 2c
Take care
Randy

2 gauge wire was probably a typo. He either ment 12 or 20 gauge. For power levels under 100W, either would be fine, or anything in between. Use copperweld wire, copper coated steel wire. The copper is a better conductor, easier to solder to and the steel will give strength. A very simple kit can be had from many sources, mail order, internet, a good electronics store, and even radio shack.

using the two standard formulas

468/f and 234/f

a CB antennas will range from 17 feet, 1 inch total wire length to 17 feet 4 1/4 inches.

Remember, we are only talking about wire length, do not include insulators.

Cut the antenna wire about 10 feet per leg. assemble the center section and then install the two end pieces about 8 feet 6 inches from the center. Just wrap the wire around the ends for now. Set it up where you want it with a temp. mount. Check the SWR on channels 1, 20, and 40. Adjust in or out depending on your requirements. Note: the antenna will "seem" to adjust backward, but this is not. The higher the frequency, or channel, the shorter the antenna, and vise versus for lower frequency or channel.

When you have got it adjuster where you want it, clip off the excess wire on the ends and solder up the ends.

An optional things you can do-

Install a 1-1 balun or place 5-6 6 inch wraps of coax right at the antenna. This will provide a little better match to the antenna and will prevent some stray signals from getting back into the rig.

the suugestion of 2 gauge cable is extreme over kill. that would be fine for
1500 watts or more but is too much for your 200 watts. the conduit is a good
idea and works very well. sometimes the lenghts come out a little different for
swr then with regular wires so it will take some playing with

For a 200 watt CB transmitter, you HAVE to use 2 gauge wire. You also
need a better ground system. Silver or chrome plated wire is best.

A jug of saltwater (like an old water cooler jug) with the bottom
filled with old pennies and ground wires run through the cork works
well for a portable salt-water ground, and will give a huge signal
increase.

With conventional 5 watt CB's and 100 milliwatt to 500 watt or larger
amateur installations, the rules are different.

That's because the amateur equipment operates on another BAND that
doesn't restrict the flow of current and voltage as much as CB, and
can comfortably use almost any gauge or type of wire (alsthough copper
or siver plated copper is best). 5 watt CB transmitters will work
perfectly well following the same guidelines.

For amateur bands and low-power CB use, the salt water portable ground
would not be adequate. You need an outside ground or counterpoise
system of some form, used in conjuction with a safety ground.

Many people don't realize about the gyro-rotational effect of charges
in the 27 MHz band. Thats why diathermy and ISM devices are allowed on
27.120 MHz, and why when a CB runs more than five or ten watts none of
conventional antenna and grounding theory applies. I even share a
patent for a medical device operating on 27.120 MHz, and I'm the
engineer who developed a few dozen devices patented by medical
companies in that frequency range.

Here's a tip: If you want to drum up business for your auctions by
asking third party questions in the newsgroups, you must make your
newsgroup posts using a DIFFERENT email address than the owner of the
auction. Posting with the same email address just makes you look silly.

Again, a perfect display of your intellect. If you had a comprehension level any greater than a two year old, it would be perfectly clear to you that I was reiterating your problem with "sideband." It is nice to see that you are defending sideband to the very last. I mean that -must- be what you are doing considering I cannot honestly remember ever posting anything to you. Hmmmmm.

By the way, since you have the mentality of a two year old, why don't you tell us some more "mom" jokes. I particularly like them actually, it is neat to see one make such a fool of himself.

Either way, you have long bored me, you and sideband that is. I'll go ruffle another ducks feathers.

get real... talk about overkill....you been reading too many books.... I once unwound a TV yoke and used it for a 80 mtr dipole. thats small guage wire.... dumped a swan 500 into it and it held up. was damned narrow banded though..and the wind broke it. the old ham motto: if it works , do it. tune for max. smoke.

lotta big words.

hamming for 35 years

You forgot to mention the aluminum pie plates on the coax for lightning protection, and the fractal reflectors to give the antenna a truly isotropic pattern. If you're going to have a 200 watt C.B. antenna you should go first class.

Ok...

Now this is getting a bit silly...

Originally I asked a few questions about constructing an antenna.. Great. I got a couple responses that seemed to answer those questions. Again, Great.

Now people are posting simply to cloud the issue, and its not appreciated.

For those of you who tried to help, I send my thanks..

For the rest of you, who purposely tried to cloud the issue, I hope you enjoyed making fun of the CB'er. I had thought the original reason for HAM radio was to share knowledge through communication.. I guess I was wrong.

Yes, the 12 gauge will easily handle 1500 watts, more actually. If you want sound antenna advice, post to the antenna group. There are some CBers that know what they are talking about but relatively few and the myths and misinformation abound.

Oh ya the antenna group. Been there lately? Bunch of children arguing about anything and everything. Couldn't take more than a week of reading that group. You probably will not learn much about antennas over there.

The original poster had a simple question about dipoles and the thread ends up with some dude using 2 gauge cable (bet you it's fun to work with!) and salt water and old penny grounding system!! Sounds interesting but kind of silly at the same time.

Check Copper Electronics' mice wiring diagram at www.copper.com.

I have a Turner +2, as well, but I'm in need of the internal wiring for it... It was old, and all the wires inside have rotted off the switches. I'm going to replace the wiring in the base completely, but I need to know what goes where. Any ideas?

Thanks.

sideband,
Your answers;
1. Sure, no restrictions on making antennas.
2. Size of wire makes absolutely no difference as long as it
can support it's own weight.
3. Use 1/4w each side, making it a 1/2 wave antenna. This will
keep the input impedance at/near 50 ohms, and easier to match
a feed line to.
4. A dipole is 1/2 wave in length. Other lengths are called
doublets. (dipole = doublet, but doublet doesn't always = 1/2
wave.)

It sounds like it should work. Naturally, the farther an antenna is
from surounding objects, the better it works. Another point is that
the closer the antenna is to your house/apt. the more electrical noise
you will hear. Also means that you may 'get into' your/others
electrical
appliances. That's not a 'hard and fast' rule, but true most times.
Good luck...

sideband,
Efficiency of the antenna doesn't change with the amount of
power it's fed. Size of conductor makes no difference in power
handling ability at the power levels your speaking of.

Doc:

Thanks for this.

Another question, now... If the impedance isn't 50 ohms (how do you
measure this, anyway?) What would my options be to get it matched up?

TIA

Part of any N.G. is just debate and junk posts. Somewhere
through it all information does leak through. What else is new.
But, as for dipoles.. they come recommended, but don't use
string, rope or spagetti. The smaller the wire the higher the Q,
but in practice you want wire that is light, remember gravity
acts on every inch.

Feed a dipole with coax unless you have a tuner and plan a long
dipole perhaps for 75 and wish to operate it multi-band.

-------clipped-------

I think the 2 gauge wire started out as a joke which turned around
and bit the poster. Same for the conduit. No need for either one.
An antenna depends on surface area/length for resonance. The base
formula; (492 X 'k')/ f(in Mhz) = L , takes wire diameter, thus
surface
area into consideration with the "k", which is the length to diameter
ratio.

Tom W8JI,
Just wondering;
1.Which cheek are you using?
2.Does your tongue get tired?
3.Does the date of the pennies make a difference?
4.Should you use ordinary table salt, or 'sea' salt?
5.Do you have to clean the jug like an aquarium?
6.Would a pan under the jug (like the one under a leaking grid resistor) help?
7.I have some 6" drill stem pipe, can I run higher power with it?
8.(see #7) should I cap the ends to contain stray RF?
9.Did you take corrolis(sp) effect into concideration?
10.If you mount the antenna on a 'lazy-susan' do you get circular polarization?

K is in mm^2? in^2?

so it'd be thus:

492 * K
--------- = L
F(Mhz)

10 guage wire is 2.61mm in diameter, or thereabouts, correct? so (2.61/2)^2*3.1415,
then convert to inches?

sideband,
Sorry 'bout that... just couldn't resist. I'm sure you can
understand that there are some things that are some misconceptions
that have been around for years, and are just plain silly. After
you've seen them for a few hundred times, you get tired of trying
to explain 'why' they are silly, and it becomes very discouraging
'cuz no one listens. You have a choice, you can laugh at them, or
cry because of them. I prefer to laugh. If your around the hobby
for a while, you'll know what I mean. But, please excuse the
levity, it wasn't meant to be at your expense.

Bob,
Sounds like the pier wasn't as large as needed. It isn't the
easiest or cheapest , but the smart thing to do it take the tower
down and start over. Next time follow the recomendations for a
pier. It's always better to 'over do' than to 're do'.
Another alternative (but not a good one) is to guy the tower
to prevent any more movement.
Also, wait till the concrete has cured properly.

sideband a swr meter is how you measure if it is 50 ohms or not ... 50 ohms would be a 1:1.1 swr , 100 ohms would be a 2:1 swr as well as 25 ohms would be a 2:1 swr ... trim each end the same or add the same to each side to get your swr down to which every frequency is of your interest..

Trying to achieve 100% modulation is not smart for several reasons.
The
first is that on voice peaks you will probably over modulate which is
a
waste of power. Keeping the modulation at 85% or lower keeps this
from
happening in most cases, and you can not tell the difference in signal
strength or intelligibility.
You can only 'push' a transmitter so far. After that, any so called
improvement is actually making things worse. Guess it just depends on
what your after, quality or quantity. One rose is always better than
a
car load of 'crap'... unless your into fertilizer.

No. The 'normal' "k" is assumed to be 0.95 for wire. The actual
"k"
can be found by dividing the length by the diameter, and then using a
chart found in most 'HandBooks'. If you don't have a 'HandBook', just
use 0.95 and don't worry about it. The formula for finding the length
of a 1/2 wave antenna only approximates the length. It gets you into
the 'ball park', and you can find a resonant length for the desired
frequency but 'trial and error', shorten it a bit and test it, repeat
as needed.

Robert, not sure if you put the tower in a hole and poured concrete around it or installed some type of bolts /anchoring into the concrete? but if it moved you may want to dig around the existing foundation and pour more concrete around it. The 4x4x4.5 should be big enough for a 48' tower, as the concrete base serves as a counter weight as well as a way of holding the tower upright. Try digging another 2' all the way around it and 4.5 deep pour some more concrete around it , this will serve to buffer what you already have you may also want to include rebar to keep things togther should you have it crack from freezing , etc
.

A full carrier that is properly modulated gives the best signal. All the swing stuff does is thrill meter freaks because they get to see output and s-meters swing which makes them think they have a "really big signal.'

Remember that your dealing with an alternating current, what you may
think of as the 'transmit half' and 'ground half' are going to be
alternating along with the signal. Both halves of the antenna are
'radiators'. I know it's not as easy to think of that way, but it'll
get you into problems if your not careful.

sideband,
Actually, the input impedance of a 1/2 wave dipole that is
put up in a 'flat top' configuration is around 70-78 ohms. If
you fed this with 50 ohm coax, the SWR would be about 1.5:1.
The easiest way to match impedances is to let the legs of the
dipole 'droop' a little bit. The legs being slightly closer
together, and nearer to ground than the feed point, lowers the
input impedance. Most people call this an inverted 'V', but
it really isn't.

Is it on a spring between the mount and the antenna shaft? If so, remove the spring, it ::should:: match up.

If not, you might do better to switch to a wilson 1000, and stay away from the "trucker" series on anything that has a large ground plane.

You may think I'm kidding, but the CBer down the road (11 miles
fortunately) has just such a ground system.

He also has the aluminum pie plates on his feedline (for lightning
protection) , and a chrome plated loading coil on his Chevy Suburban.

Please don't disapoint me, and tell me everything I've learned from
his is wrong! He is even installing a "Smoking Joe Gun" fractal shaped
addition to his CB antenna because it talks something he calls
"fatside" when he is mobile.

I haven't figured out what fatside is, but it probably has something
to do with his "back door", which he says makes him ten ate now that
it is plugged up.

It all starts with a tiny little radio, and ends up with a 4CX10000.
He put toilet floats on his element tips to prevent "fire" he says.
All of this is grounded in a water jug filled with salt water, sitting
on his basement floor.

Still have some interesting items left, including UPS unit, Falcon linear, HyGain linears, power/swr meters, Antenna Specialists 10-meter J-Pole antenna, power supplies, EFJ low-pass filter, freq counter, etc.

Check 'em out at www.hightechspecialties.com .

thank you,
Jon

Doc:

Thanks for the clarification. I had realized this, but found it easier to say it that way
than
to say "The side connected to the centre lead" and "the side connected to the shield".

This is why, when tuning a dipole, you need to take and/or add the same amount from/to both
sides of the antenna, as opposed to just the top element.

I was going for the vertical dipole idea, as opposed to the horizontal.
I'm going for an omnidirectional antenna, here, and going horizontal
would make me directional perpendicular to the line of the antenna.
Considering most of the "skip" here comes from the south, and the only
available wall I could put a horizontal dipole on would face east, that
would be a bad thing.

Hrm... I seem to have generated a thread that has gotten quite alot of
attention in the less than 24 hours of its life... Sorry to all of those who
got their mailboxes flooded on this one.

Thanks to those who really helped.

I'd say that about sums it up. His language is a bit coarse, but the message is correct.
The vast majority of CB "techs" are simply shadetree guys, who only think they understand what they are doing, mean well, but don't have the training and proper acedemic background to understand the very great harm they are doing to the radio spectrum. See? No profanity.

Hi, Doc:

You said that antenna efficiency does not vary with power applied.

I replied that the efficiency of an antenna built with PTC resistors would vary in the opposite direction, with power input, from an antenna built with NTC resistors.

'Why' was not my point -- which was simply that efficiency could be made to vary with power applied. That's all.

how can you say what it is rms wise if you dont have a meter or even know
the correct formula , if you only have 18 watts peak try maybe 4-5 rms watts
